## 3316. CPM / MSDOS mode on the Atari ?

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-13 19:43:45 UTC
From: rtdos@hotmail.com
Message-ID: <d2f74a9d.0306131143.1fc49937@posting.google.com>
Source record: 21129

random thoughts:

Wonder if anyone ever thought of "bringing back" some sort of CPM compatible device (like Indus or ATR8000) for the Atari and some how adapt it towards MSDOS 2.x or MS DOS 3.x compatability (or something like that) so that it'd be easier to xfer binaries back and forth between the two systems (not just binaries but other types of files as well).

## 3317. Atari Portfolio (i.e. was it really the FIRST pocket PC?)

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-13 19:44:57 UTC
From: rtdos@hotmail.com
Message-ID: <d2f74a9d.0306131144.1fc263b@posting.google.com>
Source record: 21130

```
atari was on to something when it developed the portfolio. too bad it
took microsoft this long to come up with a viable operating system for
the "same" idea.
```

I knew Paul (a little) met him when I did a review of Sidewinder for
Atari User at John Sosta's house. I thought Oral Cornelius did all the
sonics work on Thunderfox tho?

Don't mention Computer House :-)

A couple of friends designed and built the OS replacement that the rat
who owned it sold on their behalf, he never paid a penny to the poor
blokes.

I forget the blokes name, there was him and a berk called Chris, as
you can tell it was a case of everyone knew everyone in those days.

And there's an interesting ish story about the two blokes who made the
mod that Computer House basically ripped :-)

FWIW: CP/M mostly sucks. It does do a few things well like Wordstar, a few data bases, and maybe develop Z80 code, if you go for that kind of thing.

Certainly it could be re done. With today' chips, a small card could do
it all.
But how many want to spend $200 to $300 on such a device? I prefer just
using a 9600
baud null modem connection.

They can use the same connector, but the cable has to have 4 RCA leads.
The computers use different leads, so switch around.

The red screen probably means you need to open the machine and reseat the
chips if possible. It may also be a power supply problem.

Try rebooting with Option down for Self test.

>

RCA is a connector type, commonly know as phono. One signal and ground. The Din 5 to RCA 4 plug leads can still be found at computer or electronic surplus stores. Or the connector and cables can be bought to make one. Your colors are kind of standard today, but don't count on most things to follow that color code.

It will fit Atari and Commodore, just different leads get used for video, chroma, luminance, and mono audio(left channel). A Y adapter can feed the audio to both channels of a stereo TV or vcr input.

An adapter can be found to convert RF to seperate video and audio. A surplus VCR works great for this, as mentioned.

He has got my email address for quite some time now and I have not yet
received any mails from him with any form of advertising... Just rather
quick responses on my qestions etc...

Afaik he gets online with a terminal emulator on a MegaST using Pine etc
at his provider's shell. I don't think that's an ideal situation for
being a spammer. This may also explain why he does not participate more
in this group. It can get rather expensive if you pay buy the minute and
are online both when reading and _writing_ messages.

# 3341. eBay Atari auction for Monitor Port to SCART cable

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-14 14:21:47 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1055600613.29504.0@dyke.uk.clara.net>
Source record: 21054

Hello All,

I have put another Atari 800/XL/XE Monitor Port to SCART cable up for
auction on eBay. If your TV has a SCART socket (almost all TVs sold within
the last 7 years in the UK/Europe will have one), you can connect your Atari
to it and have almost perfect picture/sound without any tuning!

I also have some other odd items for auction too.

The link is below (this will split on to two lines, so please copy both
lines into your browser):

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=deangar

Thomas,

I looked for it but I couldn't find the document anymore.

I also tried to get it off FreeTradeZone.com and I don't have
the access to download it.

In the past I had contacted National Semiconductor about. They
photo copied the document and sent it to me. Maybe they will do
the same for you.

Hi everyone,

I'm trying to figure out how to play "Gateway to Apshai" properly on
an Atari emulator (Atari800Win)

When I played it many many years ago, I thought that you did stuff
with the keyboard, like "T" for find hidden traps, and "S" for search
for secret doors, etc, etc.

I can't seem to be able to use the keyboard at all.

Also, I can't seem to waggle my sword when monsters come my way by
pressing the "fire" button.

Anyone got any advice please?

Thanks!

Best regards from Robert.

I heard Atari forgot to connect the chroma signal until very late models.
Not noticed till then because that signal was not used much.

The 800 doesn't output RGB, and some TVs may only handle RGB or composite
but not Luma+Chroma,

You need to check your TV can be programmed to take the signal arrangement
that cable is wired up for.

See more details at:
http://www.howell1964.freeserve.co.uk/Atari/800XL/Atari_800XL_Video.htm

# 3346. Re: What happened to Atari++ Windows version?

Hi,

> Anyone knows?

Good question. I integrated SLOR's code base into the sources as much as I could, and tried to continue development with the rules of VS C++ in mind. Thus, as it currently looks like, the current version *could* compile out of the box. It's just that someone had to do it. (-;

It would take a win machine, a compiler for it, and a configuration file that defines the possibilities of the compiler. I would *guess* that I kept SLORs config file updated with each version - I hope - and could also provide it. You would also need the development and .dll files for the libSDL and some time to setup VisualStudio or any other suitable C++ compiler correctly.

Does anyone want to give it a try?

So long,
Thomas

Hmm. Seems to work fine here, though spell casting/fighting are toggled
with the console keys IIRC. "Here" means Atari++ on linux.

So long,
Thomas

## 3348. Atari and the New Mexico landfill

Newsgroup: comp.sys.atari.8bit

## 3349. Warning: not recommended

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-14 23:52:48 UTC
From: Yuval Rabinovich <yuval@lab.co.il>
Message-ID: <bcgchb$iks$1@news2.netvision.net.il>
Source record: 21062

Atari DOS 3 was never widely accepted as standard. It was the first attempt to produce a DOS system capable of using the 1050 disk drive enhanced density of 130K. It was incompatible with the earlier DOS 2 (it came with a converting utility, but using it was a pain).

Eventually it was replaced by DOS 2.5 (which is newer than DOS 3 despite the name), that gained wide acceptance in the Atari community. DOS 2/2.5 are compatible with each other and with third party DOSs. DOS 3 is not compatible with anything.

DOS 3 uses 1000 bytes per block. All other systems use 128 bytes per sector (true double density: 256 b/sector), making them more efficient in disk space usage.

Actually, there were only two advantages to Dos 3:
1. It actually used more sectors per disk then Dos 2.5. The difference is small, and Dos 2.5 had a more efficient sector management. Sometimes you could store more data on a Dos 3 diskette.
2. It supported the XIO #41 command that allowed running binary files from BASIC.

Bottom line: Do not buy it.

What do you mean by "8-bit/5200"? Do you mean "400/800/XL/XE/5200"?
Or just "5200"?

If the former, then this group is the newsgroup for 8-bit programmers.
I'm sure since the arch. is so similar, 5200 discussion would be welcome
here, too.

Source record: 21064

There is a picture of it on retrobits.net. It uses a new PAL which makes it pretty simple. I am now working on a newer version which will be compatible with an IDE controller. I am always working on newer versions of stuff - which is why I almost never spend a lot of time documenting things well. This 1meg SIMM project is a good example: instead of spending a couple of months doing a board and documents, I just made something better, the SRAM version. Anybody that really wants to make one of my hacks can ask me for help - you almost have to on many of my things. The SRAM is simple enough that I will make docs for it and send them to retrobits, OK?

Bob

by the way, the "A10 goes to pin 19" note (see text below) refers to a 4 meg version of the SIMM. But, what value is 4 megs? Loading that much ram will take a long, long time, even with a hard disk... yeah, OK - maybe 5 minutes.....

Can someone answer me on who Ben Smith is?

Honestly I am surprised, maybe somewhat saddened, by the amount of
flamage that has gone on here. Normally I would expect this of the ST
newsgroups, but not so much the 8-bit groups.

So if someone can tell me a factual account of what Ben Smith has done
and who he is to get me up to speed, I would appreciate it.

Thanks,

Think of it this way... they might be getting sponsorship from Atari, or
getting sponsorship AND making the connection with the other movies by the
Atari reference (like the Portfolio in the second movie.)

Something like that. :)

Hmmm... I get to use this ascii pic for a change.. :)

Here is a scene from T2...

The mailing list is for anyone developing for the Atari 8bit computers or for the 5200 game console. It was set up so that those wishing to discuss development of upcoming titles could do so in at least a semi-private manner. The mailing list may be moved in the near future to an upcoming domain, which should be announced shortly. And yes, as you may have guessed, I'm the one who set up the mailing list. :)

Hi there, I am looking for an old game named "Cosmic Balance" which I
once played and in the meantime lost the disc. Anyone able to sell it to
me - either the original for Atari 800 XL or a PC version ...

Thanx
Markus

# 3360. ATARI 8BIT - PM Question

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-15 10:08:58 UTC
From: nir@minicom.com
Message-ID: <83cd76b4.0306150208.5961c551@posting.google.com>
Source record: 21073

Its been a while since i played with the ATARI XL player missile.. and i cant remeber how to make a player Not to be translucent!.

I created a player but when i move it over GR.0 screen i can still see the GR.0 charecters. (although they are not colored with the tint from the player)

i already set gprior ($26f) and its still transparrant!?

i did some tests.. and if the backround graphics is gr mode E. then it works!.. the player is solid and not transparranet.. but when i am in Grpahics mode 0 or gr.8 no matter what i do the you can see what is behind the player!?!?!?

does any one remember how to make player 1 sold?

nir

gprior should do it, make the player in front.
Here's some stuff from 'Your Atari computer', page
323.
Set dmactl poke 559,46
set gractl poke 53277,3
then poke your $26f with 1 for player priority.
poke 4 for playfield priority.
If you're using XLIT, it doesn't do this correctly,
use a800dos or win.
I'm a bit fuzzy on PM stuff, but Poole gives example
programs.

Yes, it is, and it always will be. This is the way how GTIA creates the colors in its hi-res modes (Antic 2,3 and F, graphics 0 and 8 from basic). The characters take their hue from whatever color is found behind them, no matter whether this is the color 2 background or your player.

> i did some tests.. and if the backround graphics is gr mode E. then it

You can't. Not in graphics 0 and 8.

Greetings,
Thomas

Yes, sorry, I was a bit over simplistic in my original post...
for programming I meant "game development", as of course this forum does
deal with programming questions...

Basically, Tim puts it so much better!

My friend has a vague recollection of a game that he thinks is called "Captain..." something or "Commander...." something. And the only thing he remembers abut it is landing on a planet and there were, what he thinks, were chickens. He mostly remembers the music, but unfortuneately I can't humm it to you. :)

Thanks.

Hmm, I was 13 at the time, and I remember having lots of fun with Atari's Pac-Man, even though it didn't look like the original. Must be some grown-up thing that a game should look exactly like the original version in order to be fun.

I also played (or tried to play) E.T., but it really sucked. After having played it 2 or 3 times, I never took it out of the box anymore. Repetitive gameplay is nice, if it doesn't take so long. What was it? You had to gather the same parts of the same phone and phone the same home a million times in order to win? Maybe I never understood the game: at 13, I didn't read manuals :).

Basically, Ben Smith runs Bravo Sierra, an Atari dealer in the US. He has been posting advertisements on the ST and 8-Bit newsgroups, sometimes fairly often. This has made a number of people upset. As a concession, he has agreed to always begin his subject lines with [ADV], so that people could put this into a kill file, or ignore them, if they don't want to see the ads. Unfortunately, this hasn't been enough for some. Some of these people have simply discussed why these posts shouldn't be allowed in the newsgroup, while others have taken a more extreme, trollish, profane approach, slandering Ben and anyone who replies to their posts. They also send threatening hate-mail to anyone who attempts to reason with them in order to stop their pointless profanity. So that's the basic idea of what's gone on.

Who are 'us all'? Are you speaking in the name of the whole Atari
community? Have you ever got the permission of the Atari community to
speak on behalve the whole group?

This time you've gone over the edge.
Unlike you and some other cowards who take refuge behind anomynous
remailers Kenneth has done and still does lots of usefull things for the
group. He's a well respected guy in Atari land.
What is your real purpose? Are you and your brainless mates trying to
destroy this once so nice group with your meaningless and outermost crap
postings?
You and your friends are the only ones who should leave this group. I and
probably the most of the readers won't miss you at all.

I don't need to this is a public forum. Well if he likes to jump on peoples shit then he will get a piece of my mind. Simple as that. Don't care who he is or how useful he is to the group! He needs to redirect his supressed feeling to the original poster of the thread not me. I am fucking sick of this shit. I, like all of you, am an Atari user from way back and am in here for my love the machine, and also do not like to see the kind of crap that has been posted here!!!!! Now including yours. I agree that it is best to ignore that asswipe but it just pissed me off and I had to say something.

> This time you've gone over the edge.
> Unlike you and some other cowards who take refuge behind anomynous

> postings?

My real purpose is to be a Atari user and contributer to the Atari community. To read about and help others about Atari Computers NOT read about others supressed anger and backlash. That is why I am here. I have been a Atari user since 1984. Gone from the Atari 800XL all the way through to the Atari Falcon030. I am here to read about and contrubute about Atari computers. NOT to get flamed on because I didn't use my News Reader correctly!!!

Because I did not snip the "crap" that I replied to does not warrant the rude reply he made to me. Even though I should of, and will do that next time. I really didn't even think about it. He is right though I should of done that. But he could of been a little more tactful about it. Don't you agree? Or is this the theme of this "nice" group to be rude to people and not be polite????

> You and your friends are the only ones who should leave this group. I and
> probably the most of the readers won't miss you at all.

What friends are you talking about? The ones that won't take your shit when you are rude to them? If that's the way things are going to be then a lot of us will leave and all you rude bastards can hang out and bash each other.

And do not even think of including me in the same context or group as the Anonymous asswipe that has been posting his crap on here!!!!!!!!!!!!!!!!!! He is not my mate. I am just a Atari user taking a stand when someone is being rude to me. Period.

So get off your High Horse and relax. Maybe you should get off that PC and play a game of Pacman on your Atari. If you even have one ;)

> email addresses so he can spam them too.....

Well the thing you guys need to realize is that it is not really spam. Or you shouldn't see it that way in a vintage computer forum!

Here is why: So what if he posts once a week, twice a month, etc in here? Isn't it nice that there is actually a Atari store/reseller still in business for 20 year old gear? He needs to advertise somehow to us Atari freaks. Right? Yeah for you guys that are in here everyday for the last 2 years it may seem pretty old. And I see your point. But what about that NEW Atari user that just dropped in last week? Maybe he was looking for that almost impossible part and discovers that Bravo might have it. Great I say. Jeeze just because you own every freaking piece of Atari gear doesn't mean the next guy does. Give the guy a break, he is here providing a service and he does not need the kind of flak he has been getting. I am all for any people/stores/etc that offer a service to vintage computers to "spam" these forums. I think that would be the exception though.

Now it would be completely different if someone was to do the same thing for PC gear in a PC group. That would be bad!

Does this make sense? Or am I off base here? ;)

Ok now for the disclaimer: This is just a general statement on this issue NOT a flame on Smeg or others ok? I just wanted to give my 2 cents on this Bravo Sierra and Usenet issue... ;)

Thanks,
Tim

Exactly. At this stage nobody "buys" DOS to use for Atari Computers. As
they most likely already have a copy. If you do "buy" one it is for
collection purposes. After all it is nice to have an original disk with
your computer if you didn't get one or lost it.

These originally shipped with the Atari 1050 drives, and were not popular as
people liked 2.5 better. Eventually Atari went back to 2.5

Could you have had what it took to be an Atari Program Exchange author? You may never know for sure, but you can now read the APX Program Author's Handbook to get programming and documentation writing advice straight from the mouth of Atari, circa 1982.

http://www.atariarchives.org/APX/authorsguide/

We're still looking for two forms from Atari Program Exchange: the APX Program Submittal Agreement and APX Program Submission Form. If you have either, please let me know.

(racist homophobic message deleted)

want to stop this crap? next time this loser posts some of his verbal
diarhea, here's where you report it to:

abuse@dizum.com
abuse@zedz.net

-[a]- AUTOREPLY:
---

Thank you for contacting <abuse@dizum.com>. This is an automated
reply to your message. In this document you will find information
on how to contact a human. Please read through this document, it
will answer most of your questions about the Dizum Usenet Posting
Policy and it will explain how you can BLOCK your email address
from receiving anonymous mail sent by the Dizum anonymous remailer.

-[b]- SERVICES:
---

Dizum Than operates both a mail2news gateway and an anonymous
remailer. For more information on both please point your browser
to https://ssl.dizum.com.

-[c]- ANONYMOUS REMAILER:
---

The Dizum system is a remailer which automatically anonymizes and
forwards e-mail. As such it serves an important purpose for many of
its users who could not otherwise express themselves freely, or who
need to discuss sensitive personal topics.

Of course, it is not intended to annoy or harass. In case you have
received an unwanted message, the remailer offers a method to prevent
this from happening again.

To block the remailer from sending mail to your address, please send
a message containing the line

DESTINATION-BLOCK

to <remailer@dizum.com>.

-[d]- REMAILER POLICY:
---

The remailer administrator will take steps to prevent use of the remailer for any illegal purpose according to Dutch Law.

The remailer is intended for communicating anonymously, not for sending unsolicited commercial mail (UCE or spam). If you ever receive UCE from the remailer, the remailer administrator would appreciate a complete copy of the message in order to prevent it in the future. UCE will typically contain a contact address or telephone number, which is sufficient to identify the sender and -- where applicable -- take legal action against the originator.

-[e]- HOW-TO BLOCK YOUR ADDRESS
---

If you wish to block other addresses you can do so by including one line of the type "destination-block user@domain" for each address.

As a postmaster, you can block anonymous mail to your entire domain. To do so, please use the line "destination-block @your-domain.com".

If you do not want to read anonymous messages in mailing lists or newsgroups, please consult the manual of your mail reading program. The software will allow you to use `filters' or `kill files' to avoid being bothered by messages you do not want to read.

-[f]- PURPOSE OF ANONYMOUS REMAILERS:
---

It is easy to store electronic mail for a long time and to search huge amounts of data for information about people when they do not expect it. Thus, the information society may pose a hitherto unknown threat to everybody's privacy. In totalitarian regimes sending critical messages may even cause a threat to the senders' lives if their identity ever becomes known.

For that reason, anonymous remailers have been developed. Remailers use cryptographic methods to conceal the origin of messages. Each message is sent through a network of anonymizing servers so that not even the remailer administrators have any information about the origin of the message. It is impossible for us to determine the original sender of any message. Please don't ask, because we don't know either.

More information is available from the following URLs:

Technical information about untraceability:
http://www.obscura.com/~loki/remailer/remailer-essay.html
http://world.std.com/~franl/crypto/chaum-acm-1981.html

Legal information about online anonymity:
http://www.epic.org/free_speech/mcintyre.html
http://www.law.miami.edu/~froomkin/articles/ocean.htm

-[g]- MAIL2NEWS GATEWAY:
---

This service allows you to post news articles to usenet through E-mail.
It can be useful if you do not have access to a good news server, or if
you wish to post through an anonymous remailer. Note that this service
does NOT anonymize the news articles it posts. The address from which
an article is mailed will become the return address of the posted news
article.

-[h]- MAIL2NEWS POLICY:
---

The mail2news gateway is available so people who use anonymous remailers
or do not have posting priveledges at regular news servers or have their
posting priveledges revoked due to controversial opinions or flame wars
can participate in usenet discussions. The mail2news gateway is not
intended as a vehikel to post spam, advertising, binaries, pictures,
warez etc.

Please read our policy concerning Usenet postings, and than decided if
it is useful to re-sent your message to abuse.

-[i]- The Dizum Usenet F.A.Q. v1.03 (03-August-2000)
---

The Dizum Usenet F.A.Q. v1.03 (03-August-2000)

[01]
Q: Do you censor?

A: No.

[02]
Q: What is your policy on cross-posting?

A: We expect customers to be responsible when they cross-post.
Cross-posting ability is not to be used by customers for the purpose
of "cascading". We may disable the cross-posting ability if we
believe
they are cross-posting irresponsibly.

[03]
Q: What is your policy on unsolicited advertising?

A: We have a strict policy against unsolicited advertising.
We will try to weed out unsolicited advertising by applying
their heuristics into a blockfile.

[04]
Q: Do you consider make money fast (MMF) schemes to be unsolicited
advertising?

A: Absolutely.

[05]
Q: Why do you allow posting to groups that appear to be focused on
illegal activities?

A: It is our belief that a group name in of itself is not illegal and that what is actually in a group does not necessarily correspond to a group name. It is possible for illegal messages to be posted to any group on Usenet and we have no way of monitoring or controlling this. If you believe something illegal is happening, please consider contacting law enforcement so that the posters of such material can be prosecuted appropriately.

[06]
Q: What is your policy on child pornography?

A: We rely on users to follow the law which applies to Dizum and/or the user. We rely on readers to report presumed child pornography to the appropriate law enforcement agency so they may then contact us and follow-up as they feel appropriate. We do not review messages that have
passed through the server because that action in or of itself can be illegal. Further, we are not in a position to know what is child pornography and what is not.

[07]
Q: What is your policy on copyrighted material?

A: We rely on users to follow the copyright law which applies to Dizum and/or the user. If you believe that a user of Dizum has violated
a copyright you should contact the copyright holder directly. We do not review messages that have passed through the server because that action in or of itself can be illegal. Further, we are not in a position to know what is a copyright violation and what is not.

[08]
Q: What is your policy on message floods?

A: If a message flood is resulting in a denial of service, we will stop it. If a user on Dizum is causing it, we may disable their posting ability. A denial of service is when news servers are unable to perform their intended function because of the overload caused by a message flood or other harmful activity. Readers inconvenienced by numerous off-topic or inappropriate postings does not constitute a flood or denial of service.

[09]
Q: What is your policy on non-advertising excessive multi-postings (EMP)?

A: We consider excessive multi-postings to be a flood and we react to it as described above.

[10]
Q: What is your policy on binaries in non-binary groups?

A: We do not have a policy against binaries in non-binary groups and we rely on users to operate in a way that they feel is appropriate for

Usenet and/or the groups they are participating in.

[11]
Q: What is your policy on off-topic postings?

A: We do not have a policy against off-topic postings and we rely on users to operate in a way that they feel is appropriate for Usenet and/or the groups they are participating in.

[12]
Q: What is your policy on a user posting with a bogus return address?

A: We feel users have a right to decide whether to be anonymous or not and so we do not have a problem with a user posting with a bogus return address. The news server software does require that a return address be in Internet standard format, such as foo@bar, but the address does not have to be real. We do require that users verify that the address they choose to use is not actually someone else's valid address or domain. For example, bar@foo.com is actually a valid email address, because foo.com is a registered domain.

[13]
Q: What is your policy on forgery?

A: We have a policy against a user of Dizum making posts in a way that uses the email address of another user on Usenet or the Internet, in an attempt to deceive readers of the true identity of the poster, without that email address owner's permission. In addition, if you are the victim or witness to a forgery, you may want to contact the appropriate law enforcement agency so they may then contact us and follow-up as they feel appropriate. If you feel that your email address
is being forged and you do not want to make use of the Dizum mail2news gateway nor the Dizum remailer we can add that address to the blockfile. This will disable any postings with that from line. Please sent a blocking request for your from to abuse@zedz.net, please refer to question 13 of the Dizum Usenet FAQ so we know for which service we need to block your address.

[14]
Q: What if I don't like one of your customers or what they are saying on Usenet? Will you delete them for me if I complain enough?

A: No. Also, if you feel one of our customers is using the service for illegal purposes, please contact law enforcement and not us.

[15]
Q: I am going to complain to your bandwidth providers because I disagree with your views. What say you?

A: We work hard to make sure that we do not violate the provisions of any contracts we have with bandwidth providers. If a bandwidth provider decides they do not want our business, we will take it

elsewhere as necessary.

[16]
Q: One of your users is harassing me. What should I do?

A: You should probably ask them to stop or try to ignore them. If that does not work, you might want to consider contacting an appropriate law enforcement agency. We are unable to control what users say on Usenet, nor are we able to determine whether harassment is taking place.

[17]
Q: One of your users is libeling me. What should I do?

A: We do not have a way of knowing whether what is said is true or not and so we rely on you to pursue legal action against a poster if you believe a poster's actions are illegal and/or libelous. We do not review
messages that have passed through the server because that action in or of itself can be illegal. Further, we are not in a position to know what is a libeling statement and what is not.

[18]
Q: Why do you allow users so much freedom?

A: We believe that the more responsibilities we take away from a user, the more irresponsible they will act. By attempting to maximize freedom, we believe our users will act responsibly and not abuse that freedom. We run these services since 1994 and this has proven to be the
case.

# 3396. Portfolio/Serial Port

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-16 22:50:29 UTC
From: rfka01@gmx.de
Message-ID: <b1030372.0306161450.48c0194a@posting.google.com>
Source record: 21009

Hi all,

today my combo of PoFo and Serial Port just died on me. I had tried to set up the PoFo and my notebook through the serial line, when the PoFo just switched itself off. It was not to be resurrected with the serial port connected. After I hat removed the port, it took one or two hard resets to get it going again. I even got a pretty vertical line on the right side of the screen once ...
I'd rather not lose the serial port. Any thoughts or experiences ?

TIA, Robert

BUMMER! You're gonna miss the best arcade we've ever run that weekend
as well then. Sure you won't re-consider? The following games are
confirmed, but we've got about 25 more "maybe's" on the list.

Arkanoid - Revenge Of Doh
Cliff Hanger
Cloak & Dagger
Cobra Command
Crazy Climber
Crystal Castles
Demolition Derby
Discs of Tron
Donkey Kong
Donkey Kong JR
Dragon's Lair
Dragon's Lair II: Time Warp
Fire Fox
Galaga
Galaxy Ranger
Gorf
Interstellar
Jungle Hunt
Karate Champ
Kick Man
MACH 3
Moon Patrol
Mortal Kombat
Mr. Do!
Night Driver [sit-down]
Operation Wolf
Pac-Man
Pac-Mania
PlayChoice 10
Pong
Popeye
Punch-Out!!
Puppy Pong
Q*bert

Rastan
Satans Hallow
Space Ace
Space Encounters
Spy Hunter
Star Rider
Super Breakout
Super Don Quix-ote
Super Punchout
Teenage Mutant Ninja Turtles
Tempest
Thayer's Quest
Track & Field
Tron
Turbo
Vs. Super Mario Bros

New users could generally do a search on the newsgroup. In fact, old timers generally do this anyway, before asking a question that has probably been answered a thousand times.
In fact, if you had done a search for BS, then you would see what potential your last remarks had for starting a riot ;-)

Smeg.

# 3402. Finally! #wfpc channel is ready to go!

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-16 23:57:52 UTC
From: ppanks@juno.com

Hello,

The IRC channel #wfpc (dedicated to Interactive Fiction, Commodore 64/128, and Classic Video Games -- including all Atari systems) is up and running!

If you are using mIRC (or any other IRC client) make sure to connect using a random Afternet IRC server (#wfpc is supplied graciously by Afternet.org). Once that is done, you can join the channel and talk about anything related to video games, the Commodore 64/128 and Interactive Fiction.

Hope to see you there!

Sincerely,

Paul Panks (a/k/a "Dunric")

There's 2 sides to it, yes Ben makes his living off the Atari and good
luck to him but newsgroups are funny places some like adverts some
don't, some have more allowance for repeat adverts than others etc etc
etc..

What some don't like is the frequency and the fact it's crossposted as
well, I myself have had this same argument with Ben in the past
despite incorrect assumptions made by our Anon poster.

Whilst I support the idea of Atari dealers making money and serving
the community I've always said it should be a short and sweet advert
posted maybe once a week and not crossposted.

I don't support anon attacks at group members, I don't support blanket
advertising in ANY group as group then tend top become free advert
places for every single person and soon the signal to noise becomes
way out of control.

I do support our lone atari dealers like Lance, Ben and Best, good
luck to them but there's a correct way to promote yourself and
sometimes Ben's stuff strays off the path in quantity and content.

Thankfully Ben has started the idea of the mailing list which
technically should if done right offer the same if not improved
response ratio.
--

Paul...

If replying from a newsgroup remove the OBVIOUS spamtrap, if it's an email then it's
removed already.

I agree with you Tim. Granted, I wish his posts were a bit less
frequent (7 so far in June, unless I missed some), but the Bravo
Sierra posts are far less annoying than the responses, which often
number in the hundreds per month.

Galen

True. And I do use Google all the time! Even for my job! Its great when I
come up with a fix before the Net Admin ;)

But how about this argument. With frequent postings one will know that the
said seller/vender is still active and selling items. I don't like emailing
people I saw a post on 6 months prior, asking "Is that still for sale?" LOL

Tim

The first 1050s were shipped with DOS 2.0S and a coupon to request DOS 3.0 be mailed to you. We discarded it very quickly after it arrived and went to a patched 2.0 supporting enhanced density printed in Antic. DOS 2.5 came after 3.0, so you did not 'go back' to it; you went forward to 2.5 in spite of the numbers...

OK its a longshot, be here goes:

It was a trippy space type adventure involving various
puzzles and some action. It was not a text adventure.
I know there was a candelabra involved.

Any ideas ??

Posting-Frequency: 7 days
Last-modified: February 26, 2003

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

# 3415. Re: 800XL memory upgrade

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-17 16:29:12 UTC
From: Craig Hart <chart@nospam.ta>
Message-ID: <3eef4209@usenet.per.paradox.net.au>
Source record: 21028

Hey all.

I've now finished building the 1Mb Satantronic upgrade. (It's actually 1088k - 1M + 64k) Works perfectly. It's a pity it takes 9 chips to do it, but it works reallly well :-) The cost was less than 20 Australian dollars (about 10 bucks US) since, like most IT nerds, I had a box full on 1Mb 30 pin SIMMs to use.

Now, all I need to do is find some ACTUAL use for it! All I really wanted to do was run The "Too Hard 3" demo (which needs at least 256k to run...), as well as get me teeth into another fun hardware project.

I'd like to hear from anyone else who is having a go at building one, and what model you're fitting it to. I'd also like to hear anything from anyone who is trying one of the other RAM upgrades....this one works really well, but it's way too complex to build neatly! I repeat: 9 chips! ARGH!

Hmm.... what next? IDE HDD, I guess. Anyone got any pointers on where to start researching that sort of a project?

Craig

Hi everyone,

I've just been playing Rescue on Fractalus! and I have a question.

I set the difficulty level quite high - about level 40 - and I found that I didn't really stand much of a chance!

Apart from flying at top speed, are there any other ways in which I could increase my chances of a successful mission?

I'm finding that the laser turrets are hitting me too often. Is there anything that I can do? I must admit that there are certain things on the pilot's "dash board" that I don't understand.

Thanks for any flying tips!

Best regards from Robert.

# 3425. #wfpc IRC channel now up (dedicated to Classic Video Games)!

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-18 06:59:59 UTC
From: ppanks@juno.com
Message-ID: <cb0ed86a.0306172259.3f30d873@posting.google.com>
Source record: 21038
Cross-posted to: comp.sys.atari.8bit,comp.sys.sinclair,comp.sys.apple2

Hello,

The IRC channel #wfpc (dedicated to Interactive Fiction, Commodore 64/128, and Classic Video Games -- including all Atari systems) is up and running!

>>> website for #wfpc: http://www.geocities.com/dunric/westfront.html <<<

If you are using mIRC (or any other IRC client) make sure to connect using a random Afternet IRC server (#wfpc is supplied graciously by Afternet.org). Once that is done, you can join the channel (make sure to read the rules first) and talk about anything related to video games, the Commodore 64/128 and Interactive Fiction. If you need a list of servers, you can find them on Afternet's page.

Now, here are "The Rules":

>>> website for #wfpc rules: http://www.geocities.com/dunric/wfpcrules.html <<<

Here are the established rules for the Afternet IRC channel #wfpc. Please follow them as best as possible.
1. No flooding/spamming
2. No outside bots
3. No excessive idling
4. No "de-oping"
5. No crude or rude ASCII artwork

A few explanation are in order here:

Flooding/spamming: defined as excessively sending messages in rapid-fire succession. Any more than 8 in a row will be frowned upon, and 15 or more will necessitate a stern lecture/ban. Bottom line: don't flood the channel!

Outside bots: the only bot allowed in #wfpc is X2, provided graciously by Afternet's network.

Excessive idling: defined as staying in the channel for over two or three hours without saying a word. I don't mind if you idle, but please do try to say something every so often. =)

De-oping: defined as intentionally removing "ops" from those given ops. If an op is being rude or abusive, then please tell me and I'll probably remove ops.

ASCII artwork: defined as artwork which is displayed via text characters, letters, numbers and symbols. I don't mind ASCII artwork; in fact, I encourage it, so long as it is in good taste and doesn't offend. If this becomes too much of a problem, I will disallow ASCII artwork altogether (i.e. those abusing the rule will be banned).

Other than that, the rules are fairly straightforward and clear. I like to follow the Golden Rule, and you should, too!
Enjoy #wfpc!

Sincerely,

Paul Panks (a/k/a "Dunric")

Is that the Golden Rule as in 'excessive mention of the Commode 64 in
x-posts to comp.sys.sinclair results in FM smacking you with a kipper
fillet'?

*thwap* *thwap* *thwap* *thwap*

OK, well as I'm x-posting, may as well start the inevitable flame war.
OI! Apple ][ users! The Apple ][ was, erm, oh it was actually a bit
good wasn't it? OK, that didn't work according to plan...

> Apart from flying at top speed, are there any other ways in which I
> could increase my chances of a successful mission?

Don't fly in straight lines, the turrets hit you easier if they can
predict your course. Then clean up a local area by shooting all the
turrents within, collect the pilots there (watch out for alians) and
go to the next area. Don't try to land until you've cleaned up. Last
but not least, practise! (-;

Greetings,
Thomas

Well,
it is available as a so-called "prototype". Call Video 61, B & C
Computervisions or Best. The prototype includes many speech-samples like
"humanoid must not escape" and such. But: it is an endless game (and in
my eyes it gets boring very soon)... -andreas.

P.S.: There are also many Berzerk clones, in Basic, Turbo-Basic and ML.
Think Analog published one under the name syntron or Syntron 2 (one was
a Robotron clone, the other one a Berzerk clone)...

Some of you Atari XL/XE owners might be interested in the following
item I'm auctioning off:

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=3030952775&category=11991

As you'll note, it's the duo pack version with the C64 version on one
side, and the Atari XL/XE version on the other. Note about the Atari
XL's soundtrack in the item description! :)

Regards
Warren.

## 3434. Need help translating game to 8-bit...

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-18 20:15:30 UTC
From: ppanks@juno.com
Message-ID: <cb0ed86a.0306181215.4f01f2d2@posting.google.com>
Source record: 20947
Cross-posted to: comp.sys.atari.8bit,comp.sys.apple2,comp.sys.cbm,comp.sys.sinclair,comp.sys.dec

Hello,

As some of you may know, I have been hard at work for a number of years translating one of my Windows/DOS based adventure games ("Westfront PC: The Trials of Guilder") into formats for the Amiga, Atari, Apple, Commodore, Sinclair, DEC Rainbow, and other 8/16-bit machines of the time:

>>> website: http://www.geocities.com/dunric/wftrans.html <<<

So far, I have versions of my popular Windows/DOS game for the Commodore 64,128,Plus/4 and Vic-20. But I'd like to next work on versions for the Apple, Atari and Spectrum (Sinclair) machines.

For comparisons, the C64/128/+4 versions are available at:

>>> http://www.geocities.com/dunric/c16.html <<<

The Atari, Apple and Sinclair Spectrum versions should be somewhat similar to the Commodore 64 version (dubbed "Westfront 64"). However, as you can see on the first linked page way above, the goals for the game vary on the built-in/cartridge/disk based BASICs available to each machine.

On the Atari 400/800 series, I would prefer to squeeze it into 24K or less. Most people using the Atari machines have 24K or more memory available to BASIC. 16K is too paultry for such tasks. I'd also like to get multiple colors on screen at once, in text mode, both I'm not sure which "Graphics" mode to use. Having programmed "just a tad" on the Atari machines, the strings always frustrated me because they were vastly different than the Commodore 64 BASIC's version of them.

On the Apple, I would prefer to make it as Apple IIc/IIe compatible as I can. Few (if any) people still use the original Apple's from the 1970s, and the success of both the IIc and IIe as commercial products convinced me to do a version for the Apple computers. I believe the original Apple II used a different version of BASIC than both the II+ and IIe (correct me if I am wrong, of course).

Finally, on the Spectrum, I'd like to use the Speccy 128's BASIC for the game, simply because of more memory, better graphic capabilities (think of "Retarded Creatures and Caverns", a Quill game), and more dialogue possible.

The Speccy version could easily slam the Commodore 64/128 version's butt, and would be a nice project for any "anti-Commodore" fellows out

there (just throw in a demo at the beginning of a "Commodore Logo"
crashing in flames, followed by Clive Sinclair in a Red Baron circa
bi-plane).

The Commodore versions are already complete, so check them out and see
if translation to your favorite machine is something possible:

>>> http://www.geocities.com/dunric/wftrans.html <<<

Sincerely,

Paul Panks (a/k/a "Dunric")

> >pin SIMMs to use.
> I've got a box of those too. I'd like to try an upgrade using one, but
> I've got so many projects on hold right now...

It's about a solid 2-3 evenings work for an experienced person to build from scratch. You can build the 130XE part first and test that (add 128K) then do the second part of the circuit for the full 1M later.

> Did you have any particular problems, or can you offer any tips for
someone
> planning on building it?

All parts are 'garden' variety, so it's easy to put together - 9 x 74HC chips, a few resistors and a filter cap or two for good measure. The most arduous tasks are finding the right points on the atari to solder to, and hooking up the jungle of wires. I got the full schematic for the 800XL from the web, and used that to buzz out the locations on the PCB with a multimeter.

You also have to bend out some chip pins (or cut PCB tracks) - on my 800XL, everything was socketed, so I just unplugged the chip, bent out the pins and reinserted.

> What model did you put it in?

As per subject line - 800XL. I can post pics on the web if you like....

It should be simpler on a 130XE, since half the circuit already exists on it. a 65XE may also be easier if it already has the extra CMMU chip already present.

Craig

# 3437. FA / FS : Many boxed ATARI XL/XE carts , new

Look at :

http://cgi6.ebay.de/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=klassische-videospiele&sort=3&page=1&rows=25&since=-1&showpics=1&stab=0

I have the games for ATARI XL/XE on cartridge , all the games are new
, boxed + instructions and shrinkwrapped , never been used.

You may bid for them on ebay or buy from me directly.

The first price is for a game in great condition , the second for the
same game with slightly damaged box (usually slightly crushed).

prices are in Euro , 1 Euro is ca. $1.18 now.

I can ship worldwide and accept paypal for payment.

Shipping is $7 for one game (worldwide) or $9 as Air Mail
4 Euro for one game in Europe

$14 for 1-15 games worldwide (surface mail) or 8.20 Euro for 2-15
games in Europe.

List of games :

Ace of Aces 8 Euro/6 Euro
Airball 10 Euro/8 Euro
Archon 6 Euro / 5 Euro
Ballblazer 6 Euro/3 Euro
Crimebuster 8 Euro/6 Euro
Crossbow 3 Euro
Davidï¿½s Midnight Magic 6 Euro/4 Euro
Desert Falcon 6 Euro/4 Euro
Eastern Front 1941 8 Euro/6 Euro
Final Legacy 6 Euro/4 Euro
Gato 5 Euro /3 Euro
Hardball 6 Euro/4 Euro
Joust 6 Euro/4 Euro
Loderunner 8 Euro/6 Euro
Millipede (large box) 4 Euro/2 Euro
Millipede (small box) 4 Euro/2 Euro
Moon Patrol 7 Euro
One on One Basketball 6 Euro/4 Euro
Pole Position 7 Euro/5 Euro
Rescue on Fractalus 10 Euro / 8 Euro
Robotron 2084 8 Euro/6 Euro
RS Football 8 Euro/6 Euro

Star Raiders 2 6 Euro/5 Euro
Thunderfox 5 Euro/4 Euro
Tennis 5 Euro/4 Euro

Disk :

Mickey in the Great Outdoors 3 Euro/2 Euro

Cassette

Scram 4 Euro
Touch Typing 5 Euro

Hello, some of you may know me as the Anonymous Loser! The Nomen Nescio of online idiots! I spend all my worthless time in my moms basement spamming newsgroups and pestering people with my lifeless existance!!! I live in the New England area near the Holland Tunnel and frequently get rejected by girls that I try to ask out!!! Since I never had a girlfriend I am here asking for help! I want your help so bad that I am willing to try 30% harder to be a descent citizen and get off my ass and get life!! I am willing to lay off the twinkies, turn a new leaf, and actually take a shower and comb my greasy hair!!!! With your help I can actually start at the bottom and work at a fast food joint if need be! Can any of you great lads lend a pathetic online loser a helping hand short of putting my miserable existence out of my misery??!

I would appreciate a helping hand from this great community that I have entertained so much of recently!!! I can be reached at nobody@tatooine.homelinux.net or nobody@dizum.com !! Or reply here! Since I have no life I will reply back right away!!!!!

Thanks in advanced for your business!!!

30% better effort to not show my face in here and annoy you again!!

# 3445. help copying disks to unix machine

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-19 18:30:26 UTC
From: fine@head-cfa.harvard.edu
Message-ID: <3ef20142$1@cfanews.cfa.harvard.edu>
Source record: 20958

Hi,

I'd like to try to get what's left on my old Atari disks and copy them onto my Unix (Solaris) machine at work. I can hardly remember what's there, although I know I had a nice disassembler I wrote in basic, and my own vt100 emulator with an 80-column text display, and a custom protocol for viewing monochrome images. And a font editor (in basic). I also hacked my own level cheat into Jumpman Junior. Who knows what other wonders await me.

I know there are various SIO to serial cables that can be had, and software that I can probably port to Solaris to do this, but perhaps there's a simpler way. I have an 850 interface. Can I just connect the serial port on the 850 to the serial port on my computer, and then copy files using R: as the destination? Would I just end up with the file on the unix side, or is there also some protocol involved?

Can I do this for duplicating whole disks? Again, would I simply get a dump of disk contents, or is there some protocol like "send next sector"? And once I've done this, how do I turn the results into a .atr file?

I may at some point want to use the Unix box as a disk drive for my Atari 800. Is there some software I can run on the unix side to make the R: port act as a disk drive? Or at that point am I better off with one of the SIO cable solutions?

Finally, if the disks don't read well, or my 810 drive is shot, where can I go to "recover" the data? Or should I just sprinkle metal filings onto the surface of the disk, and decode it visually? :-)

Thanks,

tom

Source record: 20959

Hello,

Yesterday I bought an Atari 400 at a thrift store for 5 dollars. I took it home and it works and everything, but there is something I just can't figure out.

I put in a BASIC cartridge and I attempt to write a program... but after I write a line and hit the RETURN key, the system freezes and I can't type anymore.

Am I missing something here? Is there some trick or something after you write a line in Basic? I have used the default OS on the computer (memopad or whatever it is called) and was able to hit RETURN no problem.

Thanks

You might want to check the cartridge. I got an Assembler Editor cart a while back for my 800xl... I popped it in, everything booted fine and keyboard entry worked, but it would lock up every time I try to execute something (i.e. hit return). I opened up the cart and found that a couple of the IC connections were broken and not making contact with the socket. I got a replacement cart and everything worked fine.

Source record: 20961

Hello Fellow Vintage Computer Enthusiasts,

On about the first of May I implemented a web-based messaging board as an adjunct to my collection website at www.vintage-computer.com/vcforum.

Since that time these message boards have been well used by the 80+ registered members (and by several times that many visitors) who have posted over 100 messages a week on a wide variety of classic computing topics.

I believe that the draw of the forum is simple. It provides a dynamic, easy to use and persistent place to share categorized information, images and ideas about all things related to vintage computer topics. I am convinced that these forums will continue to grow into the vibrant community that I and all of the other VC Forum users envision. We're already most of the way there!

Please join us in building this community by visiting the forum, signing up (all you need is an email address and I promise it will remain protected for use only by the forum itself), posting an introduction and then joining any of the many ongoing threads. Whether you own an Altair or a Zorba or anything in between I'm sure you'll find someone else who's as passionate and knowledgeable about the machine as you are.

I hope to see you there!

Erik Klein

> the serial port on the 850 to the serial port on my computer, and then
> copy files using R: as the destination?

You need a nullmodem for this and a terminal program running on both systems. Also remember the RS232 pinouts of the 850 are not
the same as used on PC systems.

> Would I just end up with the
> file on the unix side, or is there also some protocol involved?

Just upload / download with the terminal software, using the same protocol on each side of course :-)

> Can I do this for duplicating whole disks?

You can make an image of a whole disk on the Atari using DiskCommunicator 3 (DiskCom3), available on the net from various sources
and also on my site. http://thunderdome.atari.org

> Again, would I simply get
> a dump of disk contents, or is there some protocol like "send next
> sector"? And once I've done this, how do I turn the results into a .atr
> file?

For MS-Dos there are conversion-tools to convert a DiskCom image into an ATR image. I asume there are also tools available for
unix which do the same.

> I may at some point want to use the Unix box as a disk drive for my
> Atari 800. Is there some software I can run on the unix side to make
> the R: port act as a disk drive?

On MS-Dos (windows) one can use A.P.E. (Atari Peripheral Emulator) of SIO-2-PC to emulate multiple diskdrives on a PC system. You
need a simple interface (SIO2PC interface) to connect between the PC and the ATARI SIO bus. No 850 required. unix software exists
which does about the same.

> Finally, if the disks don't read well, or my 810 drive is shot, where
> can I go to "recover" the data? Or should I just sprinkle metal filings
> onto the surface of the disk, and decode it visually? :-)

Let me know if you succeed :-)

On 19 Jun 2003 at 11:55:13 -0700, "zool" scribbled:
->...after I write a line and hit the RETURN key, the system freezes
->and I can't type anymore. ... Is there some trick or something
->after you write a line in Basic?

Nope. If you typed a legal line in Atari (a.k.a. Sheperdson)
Basic, nothing special happens. If you typed an illegal line, Basic
will echo it back marked as "ERROR." Either way, the cursor moves
to the next line, you're still "live," and you can continue typing.

->I have used the default OS on the computer (memopad or whatever it
->is called) and was able to hit RETURN no problem.

That memo pad mode isn't an OS; it doesn't support anything. For
practical purposes the only thing it's good for is showing whether
your keyboard works.

I'll assume you've connected the 400 to a television via a game
switch; at this point the screen (S:) is your only peripheral
device. To do anything, you'll need other hardware (disk drives,
printer, joysticks, whatever). But even without anything else, you
should be able to LIST your program lines on the screen or RUN your
program.

Try typing "? FRE(0) <RETURN>" [in Basic, without the quotes] to
see how much free RAM you have. Does this also cause lockup? The
Atari has a very strong System Reset key, but you shouldn't get
lockup after simple stuff like this.

If it is programmed in Applesoft Basic under Dos 3.3, it would be the most compatible with most Apple II's. Whereas, ProDOS 8 is more suited to the Apple //e and later models with support for subdirectories, together with other advantages being the newer OS.

I would like to see that JumpMan Jr patch as I rarely pass Hell Stones will
all lives intact and have never seen the top three or so levels...

With your 850 you can use a null modem cable with terminal programs on each
platform to up/down-load data files. You would need to compress boot disks
in order to transfer the entire contents; Discom will compress a disk into a
file on the A8 and run on an emulator to regenerate the data onto an image
file on the other system.

With the SIO2PC any DOS allows you to simply duplicate a disk onto an image
ATR/XFD.

Hmm, as today is im-/export of chickens allowed to the Netherlands? There
are probably still some restrictions due the recent outbreak of fowl pest.

Also if I'm not wrong there are some problems in the USA (or is it Canada?)
with the mad cow disease. Now I think about it, that's maybe the problem
with him. So he probably won't get the permission to jump on the plane.

if he types something and it freezes (can't type anymore) then the problem
is likely the BASIC cartridge. Open it up and check it out.

>
> Hmmm
>
> Tim

Wish I could say it was that complicated.

First off, that auction is simply a 520 ST shell with a non-working keyboard. (Though all the keys have all the rubber bits, so maybe good for parts).

THE TRULY INTERESTING PART...
Once apon a time, I took a 1040 STe, upgraded to 4 meg (that I'll be selling soon.. just want to get the floppy drive working better first... all else works).

I took the then 4160 STe :) and took it apart, re-cased it, a CD-Rom drive, hard drive, Spectre GCR, and a AT Power Supply and stuck it all in a PC case that had a similar case style as an Atari 800. The idea was that was doing the 800XLDJ thing (virtual drive system) for the Atari 800. The case and the AT power supply (modified to power an Atari ST/STe plus multiple other devices AND a monitor all at once) will be for sale soon as well. Or if you read this and are interested, just write me at drclu@swbell.net.

The wire between the keyboard and the motherboard was extended from 6 inches to about 6 feet using some flat lan cable... so at that point I had an external keyboard. Once that was out, the 520 ST case housed the

keyboard (being the smallest ST case in existance.)

Incidentally, the person who buys the 4160 STe will have that six foot chord to have an external keyboard whenever they choose. (and a SM124 monitor, and maybe a color monitor and monitor switch depending on the deal) :)

So I can say I've gone through what so many Atari users go through... to have the Atari STe go from the all in one boogle board, to a PC case and desktop computer. But in this case, there was a chance to go back, since it is all back together again. :)

(People like vintage STe's over re-cased ones.. I can see why I suppose..)

## 3470. Argh... CX 85 woes...

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-21 08:59:46 UTC
From: Undead Mechanic <davidb81@earthlink.net>
Message-ID: <68VIa.58004$Io.5416815@newsread2.prod.itd.earthlink.net>
Source record: 20983

I beseech thee... I come in search of long lost knowledge.

I have a CX85 keypad and I have been looking for a driver/handler (either in code or available for download) for this blasted thing for ages and, so far, have had squat for luck. I'd write my own, except for the fact that none of my memory maps say anything about the joystick ports aside from their up/down, right/left, and fire button locations.

I'm not sure about this, but I'm thinking that it (the CX85) may use various combinations of the fire and directional buttons to accomplish it's task.

If I could at least find a schematic of the thing, I think I may be able to program a routine to handle it.

Any and everything is very much appreciated.
David Bowden

# 3473. New eBay auctions: Atari Monitor Port to RCA Phono/SCART cables

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-21 14:00:24 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1056204136.63964.0@eunomia.uk.clara.net>
Source record: 20986

Hello All,

I have put another Atari 800/XL/XE Monitor Port to SCART cable up for auction on eBay. If your TV has a SCART socket (almost all TVs sold within the last 7 years in the UK/Europe will have one), you can connect your Atari to it and have almost perfect picture/sound without any tuning! NOT suitable for SECAM (France/Russia) machines.

I have also started a new auction for a Monitor Port to RCA Phono cable. This is suitable for any TV with RCA Phono (AV) inputs. It will work fine for PAL or NTSC systems, but NOT SECAM (France/Russia).

The link is below (this will split on to two lines, so please copy both lines into your browser):

the CTH archive has some files for the cx85, including
a driver for SpartaDOS.
ftp://ftp.spudster.org
I suggest you download the 'allfiles.zip or *.txt' and
search for cx85.
There's a cx85.m65, which I guess is a mac 65
source for a driver for it, in the programming
directory.
in utilities/files/misc there's a cx85d.arc which contains
the spartados driver.

These ink pens can be refilled!! And they can be refilled without drilling holes :) If anyone needs their pens refilled I can do it for them for $4.00/pen minimum 4 pens, shipping included. They should have caps on to help keep the ink from drying but testing so far has shown me that when refilled they are quite resilient to drying up. PLEASE hang on to your old dried up pens. They arent making these anymore, afaik, and once they are gone, thats it. Sources are dying up very quickly as alot of big industries still use these pens for their equipment and buy them in huge quantities.Even the mills around my town here uses them for their graph printers.Also, alot of the "new,old stock" ones are drying up inside the packages, so even if you buy them you arent necessarily guaranteed to get working pens, unfortunately. Remove spam block to email.

Too bad someone can't get them made in China. The dollar stores seem
to have an endless supply of ball point pens from there - even 10
color pens for $1.00! These should be easier to make.

BTW, anyone try 1-800-THE-SHACK ?

Yes, I know that. I did it a few times in the late eighties (when they
became to be difficult to buy (in my place at least) and still in the
early nineties...

> If anyone needs their pens refilled I can do it for them

You mean that they dry-out faster than the original? That's exactly what
I experienced in the past.

> PLEASE hang on to your old
> dried up pens. They arent making these anymore, afaik, and once they are
> gone, thats it.

If those are no longer produced, then I think we have to go another
way... Continued in the next post

Actually I meant the opposite. So far I have left the refilled pen out
without a cap for 4 weeks and it still writes instantly as soon as it
touches the paper.I dont know how well original pens faired with the caps
off but this is a good thing so far. :)

I have the 'flat bed' plotter, the one that you have to manually change
the pens. I use it for graphing.

Anyway, I use 'stamp pad ink' to refill the pens. I got it in 'roll on'
bottles,
almost like deodorant. I popped the top and use an eye-dropper to refill
the pens. They don't dry out for a LONG time, and the ink is viscous
enough that it doesn't blob instantly if a pen is left down.

Mike

# 3484. Journey to the Planets...

Hi everyone,

I've been playing Journey to the Planets recently, and I really like it.

Apart from Ghost Encounters, (another JV software title), are there any other games like it, in which you have a series of puzzles to solve? (It doesn't matter if the game is set in space or not - I just like the puzzle solving aspect of the game.)

Thanks for any information.

Best regards from Robert.

Nope, not yet anyway. I just checked my radio shack pens and they are a bit different than the commodore and atari pens. Maybe thats why you had trouble, Im assuming your working with RS pens, Neil? I havent tried to refill a RS pen.As of yet I dont have any dead RS pens to try to refill and I dont want to sacrifice one.Hopefully someone will send me some RS ones so ill get to experiment.Another thing is be gentle squeezing in the ink or you end up with it all over your hands. It can be messy for sure but worth it in the end.

From: Mark Watson <newsAfoftDfsnetD@co.uk>
Message-ID: <yfoJa.2524589$uT2.378464@news.easynews.com>
Source record: 20850

Anyone here want to play with Atari 8-bit games on a handheld console? If so
you may be interested to know I just released the first version of my port
of the Atari800 emulator to the GP32. Take a look at
http://www.scrameta.net for more info.

Many thanks to the Atari800 authors for a fantastic emulator:-)

Thanks,

Mark

Seems our little creep from New York/Jersey has moved to this remailer....
having recvd a little email from him.

admin@italy-anonymous-remailer.it

Well, this is quite interesting because Italy is a EEC member and the data
protection/abuse laws are slightly different here... ie Web Services are
responsible for the usage of their services ( as per recent Demon case)....
I am obviously contacting them direct and will if I have to give them a
little legal nudge... keep you informed

You are chasing your own tail here I suspect. Using multiple remailers means that the Italian remailer can only give you the name of the remailer they got the post from.

Nobody is going to bother with tracing back an anonymous email all the way back to the source because it is probably sent from a public computer (internet cafe, library or university or similar) if the poster is clever. Even if he isn't, there is a multitude of software and online mailers that will fake the originating ISP as well.

It's a waste of time, using a filter and not replying to his messages is an easier and smarter way of preventing this rubbish IMO.

## 3490. 130XE bad joystick port

Thank you, anonymous coward a.k.a starwars nobody@tatooine.homelinux.net.... my kid reads this group. We've actually order from Ben (quite awhile ago) and we still use our Ataris.

Guess which one of you two appears problematic in the group?

---
http://www.mental-health-matters.com/disorders/list_alpha.php

Paranoid Personality Disorder

Description

Paranoid Personality Disorder essentially is an ongoing, unbased suspiciousness and distrust of people. Along with this, the person suffering from PPD is emotionally detached. In order to have this diagnosis, the person would have to have seen others as having malevolent intentions, by early adulthood in different situations, as indicated by a number of different factors. These factors include: suspicion that others are exploiting, or deceiving them, that others may not be loyal or trustworthy, believes there are threats or attacks on their character in innocent statements that others do not see, and bears persistent grudges.

Schizoid Personality Disorder

Description

A person with Schizoid Personality Disorder has minimal social relationships, expresses few emotions (especially those of warmth and tenderness), and appears to not care about the praise or criticism of others. They appear absentminded and aloof, but are actually very shy. While they do not do well while in contact in groups, they may excel when placed in positions where they have minimal contact with others.

Schizotypal Personality Disorder

Description

Schizotypal Personality Disorder is marked by a lack of, and reduced capacity for, social and interpersonal relationships. The person with this disorder also has cognitive distortions and eccentricities of behavior. They often have magical thinking (if I think this, I can make that happen), paranoia, and other

seemingly strange thoughts. They may talk to themselves, dress inappropriately, and are very sensitive to criticism.

Dear Classic Video Gaming Fans:

A *new* IRC channel devoted to Classic Video Games, Interactive Fiction, Commodore 64/128, Atari and Apple has been set up on Afternet's IRC network.

The channel is #wfpc. "Classic Gaming at the Core!"

Login today to a random Afternet server using mIRC (www.mirc.org) or any one of the other popular IRC programs out there!

So if you're tired of the #rgvc and #c64 scenes (like me), hop on to Afternet's wonderful IRC network and join #wfpc today!!!

The channel is #wfpc. "Classic Gaming at the Core!"

Sincerely,

Paul Allen Panks

I have one (1) working Commodore 1802 monitor available for FREE, IF YOU PICK UP. I live in the central Indiana area, SW of Indianapolis. I got it used, and the composite video and audio have worked fine in my use, but the Separate Video inputs do *not* work. I have *not* tried to repair it, so I don't know WHY the separate inputs don't work.

It is offered AS IS, with no guarantee of any type.
I will *not* ship it (sorry). Send an email if interested.
In case of multiple interest, earliest email "wins".

Larry

Does anybody knows if it is possible to use California Access CA-2001 (or LDW Super 2000) disk drives with 1050-2-PC or ProSystem?

If you're interested in a Magnavox Color Monitor, you can swing by my place while you're in Indy as well! Same deal - free to anyone willing to come get it. However, I would ship if someone wanted to pay for the shipping.

I guess if they are able to run at the same speed as a 1050 does it should work. If those droves are more like an XF551 (or XFD
drive) chances are that it'll not work.

The CA-2001 is one of the drives I still want to lay my hands up some time, just as a TOMS 710 diskdrive...

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

So, that makes Atari a French company, doesn't it?

Funny that before Atari turned French, Atari was a purely American company (and allmost dead), but now that it is French, all product information can be accessed from around the world.

> The Atari legacy of innovation lives on!

So, the Atari 2600 is coming back for it's third life? Or are they finally going to make a console that can compete with the rest? I do hope so. I also like the idea of finally having some innovative games again, when are they going to come out?

PeterV

More like a French company has bought the Atari name and used it for a
rebranding excercise.

> (and allmost dead),
Totally dead.

> like the idea of finally having some innovative games again, when are
> they going to come out?
Just the same stuff as before but with a different name on the box.

# 3526. A few new eBay Atari auctions

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-24 12:54:14 UTC
From: dgs@clara.net
Message-ID: <3568e886.0306240454.1c6e5104@posting.google.com>
Source record: 20889

Hello All,

I've just started new auctions for some Atari 8-bit items, including some software I haven't put on before. I still have the Monitor Port to SCART and Monitor Port to RCA Phono cables for auction. These are great if you have an Atari with a poor output over the RF (TV) cable. They are suitable for NTSC/PAL 800/XL/XE machines, but not SECAM (France/Russia). The SCART version is mostly for UK/Europe, where all TVs sold within the last 8 years will have a SCART socket. The RCA Phono version will work for any TV with RCA inputs (Composite Video/Audio). This is suitable for use in non-SCART countries, but also for SCART enabled TVs with RCA as well. This will allow you to keep the SCART socket free for other things (DVD, VCR, Cable box, etc.). The improvement in picture and sound when using these cables can be amazing! I have an old 800 which just doesn't tune well, so it looks like watching through fog! With the SCART cable it looks like a new computer!

The link is below (if it splits onto multiple lines, you may need to cut/paste the whole link into your browser):

I think Ultima 3 used color artifacts to get green and red. I don't know about XFormer 2000 options/settings, though. Might want to see if it has any that seem to enable or disable color artifacts.

Thanks a lot Jeff.

I've now completed Journey to the Planets!

I only cheated once - I didn't know how to fly across the chasm on the
Ruby Chain planet.

I found it very handy to save my position (using an emulator) as I
went along.

I'm now trying to complete The Goonies.

Best regards from Robert.

I'm wondering if I can find suitable (but too long) pens or refills
locally, cut them down to length, and block the open end. That would
be an easier way to reload the printer.

Thanks Larry.

I tried AtariWinPlus 2.8 and used the color atifacting and now Ultima
looks just as I remember it.

One problem. AW2.8 keeps crashing. I've tried disabling the patches.

I hate to be a bother, but I would rather play Ultima 3 on the atari
than any other machine.

Any Ultima fans out there that can shed some light on my situation?
Should I use another emu?

Thanks!

From: BD <Jason>
Message-ID: <av8hfv4uo3vo59e6tbb4dsjnc3d47t10bi@4ax.com>
Source record: 20897

Well, I've now tried AW3.1, several roms 800,xl,xe and with and without patches. I've set AW to PAL and NTSC.

Ultima 3 loads fine, I can create a party, which by the way isn't being saved and I have read/write enabled, and for it. It bombs when I try to 'Journey Onward' and load the main game.

Perhaps I'm not setting up the images correctly?

Thanks again for the help.

I'M A COMPLETE IDIOT!!!

I forgot, (it's been a while) that you first load the main disk image
to create your party then load the player disk to play the game.

Thanks again for the quick responce!

Uh, no. Infogrames (I don't care what they call themselves, they are
*not* ATARI) is strictly a software company. We've seen the ATARI
multi-game joystick thingy and an Activision gamepad doohicky
(Infogrames owns the Activision name too, I believe), but those were
licensed items produced by another company (Jakks Pacific, iirc). I
think it'd be really cool to see an even smaller 2600jr, or maybe the
same one again, but I doubt there will be any more cartridge-based
consoles bearing the ATARI name, and you can pretty much bet that this
incarnation of ATARI is *not* going to move in and challenge SONY and
Nintendo with an up-to-date console, either.

They're basically just trying to get a return on their investment, and
I don't think that was happening fast enough with the "classic" titles,
so now stuff like Enter The Matrix is being sold with the ATARI logo on
it (probably because ATARI is "hip" again, hence all the t-shirts,
etc.)

At any rate, it's all hype and very little substance. How very 21st
century.

Dear Classic Gaming, Interactive Fiction, Commodore 64/128, Apple
II/IIe, and Atari 400/800/xl/xe Enthusiasts:

The new IRC channel (on Afternet's network), #wfpc, is now being
operated to run specifically during the 6pm-7pm MST/PST timeframe,
M-F, on a trial basis.

Once people start joining, I will expand it to a 24 hour channel.

As is it approximately 6:13pm Phoenix, Arizona time, the channel is
currently open for others to join and discuss the previously mentioned
topics of conversation.

See you there!

Sincerely,

Paul Allen Panks (a/k/a "Dunric")

Yes they are. Get over it.

is strictly a software company. We've seen the ATARI
> multi-game joystick thingy and an Activision gamepad doohicky
> (Infogrames owns the Activision name too, I believe),

*rolls eyes*
No, Activision owns the Activision name.
www.Activision.com

>but those were
> licensed items produced by another company (Jakks Pacific, iirc). I

And why should they?

> They're basically just trying to get a return on their investment, and
> I don't think that was happening fast enough with the "classic" titles,
> so now stuff like Enter The Matrix is being sold with the ATARI logo on
> it (probably because ATARI is "hip" again, hence all the t-shirts,
> etc.)

If you knew anything about the current Atari, you'd know that they have
always valued the Atari name and began using it on their high-profile titles
almost immediately (but without a lot of fanfare). Highly thought of

titles such as "Neverwinter Nights", "Ikaruga" and "Godzilla: Destroy All Mosters - Melee" all carried the Atari brand (some crap did too, but what else is new in the world?). As the then Infogrames built up the profile of "Atari" as a name for modern games, they finally decided to take the mantle on themselves. And I don't care if they are still primarily French based, they are as worthy a successor to the Atari of old as anyone else. I'd rather have a company named Atari making games of all kinds for people to play then it just being a bunch of properites shuffling from company to company, stuck in people's minds as a thing of the past.

> At any rate, it's all hype and very little substance. How very 21st
> century.

I fail to see why this is hype. It might have been hype if they had no games to back the move up with, but the fact is they are very successful right now, both critically and commercially. (Not always both on the same games, but, again, what else is new?) It seems to me that the current Atari has a greater degree of respect for the Atari name (if not necessarily the totality of it's history) then you (and all other "new Atari" bashers) do. You would seem to only be happy if the Atari name was dead and gone, relegated to the ashcan of history. It's like you're jealous of anyone else getting ahold of "your" Atari.

Wake up, son.

Atari lives.

"In the Beginning..."
// A parody of Atari, Apple and Commodore based on Genesis and other
verses from the Bible (KJV).
By: Paul Allen Panks (dunric@yahoo.com)

"In the beginning, Nolan Bushnell created the Heaven and the Earth.
And Atari was without form, and void; and darkness was on the face of
the Nolan. And the Spirit of Nolan moved upon the face of the waters.

"And Nolan said, 'Let there be Syzygy' and there was Syzygy

"And Nolan saw the Syzygy, and saw that *it* was good.
and so Nolan divided the light from the darkness, calling it Atari."

"Nolan rested on the 7th day...to make Andy Capp full of pong!"

"And Nolan told Warner all that Steve Bristow had done, and withal how
he had slain all the Pong Clones with the Sword."

"Now Ray Kassar slept with his fathers, and was buried with his
fathers in the city of David. And Steve Morgan his son reigned in his
stead."

"And their father gave them great gifts of silver, and of rainbow, and
of precious games, with fenced cities in Silicon Valley: but the
kingdom gave he to Steve Morgan; because he *was* the first born."

"Then Morgan went forth with his princes, and all his chariots with
him; and he rose up by night, and smote the Coloeco-ites which
compassed him in, and the captains of the chariots."

"And it came to pass, *that* when Morgan had read three or four
leaves, he cut it with the penknife, and cast *it* into New Mexico
that was on the shelves, until all the games were consumed in the
desert that was on the earth."

"Tramiel answered and said unto him, "Verily, verily, I say unto thee,
Except a man be born again, he cannot see the kingdom of Atari."

"Tramiel answered him, "If I have spoken evil, bear witness of the
evil: but if well, why smitest thou me?"

"Tramiel answered, "Thou couldest have no power at all against me,
except it were given thee from above: therefore he that hath delivered
me unto thee hath the greater sin."

Sincerely,

Paul Allen Panks (a/k/a "Dunric")

always thought it was... just a game company.

How would you like it if some guy grabbed a camcorder and re-did Plan 9
From Outer Space in his back yard because he wanted to "continue the
tradition" of Ed Wood, who was nothing more than some guy who made bad
movies? I don't think that would sit too well. To debase something by
perpetuating the myth that it really was as one-dimensional as it
seemed is NOT "respect".

Atari started out as a game company. Only later, making computer (which, to me, were the well-equal of the gaming division). They're simply back at square one... gaming, just no "Atari hardware" to run it on. No arcade machines. No computers. No consoles.

But I honestly believe that, now that Infogrames has, in near totality, taken on the name of "Atari", we who would desire to bring back the "hardware" portion of Atari's legacy, are much closer to that goal than ever before.

We need only present a reasonably iron-clad plan of action and a prototype product. If all of Infogrames' (now Atari, Inc.'s) software subsidiaries are now called "Atari", what makes one division any different than another? Could not one or even two of them be devoted to writing software (apps, utilities, games, etc.) for a new Atari computer? Surely so! If Atari, Inc. has no desire to design or make hardware, let those who have the desire...do so!

I will write another message around this topic, for I am fired up once again to purpose!

Atari is more alive, as never before, since the selloff from JTS to Hasbro and then off to Infogrames. What I once dreaded (the endless "namebrand graveyard scenario") has been decimated and the name once again holds substance and vitality!

"Atari" is "Atari" to me, so long as it is a company, right and proper. Atari is now a company once again (I really hated the languishing years between Hasbro and Infogrames, where "Atari" was nothing more than just another namebrand slapped on a game box), regardless who runs it and under what guise it is named therein. It may not be the Atari of old, wherein the 2600VCS and Atari 1040ST I loved so were created, but it now has substance again. Atari has presence (street addresses and phone numbers and URLs). And, as an added benefit... it has instantly returned... across the globe!!!

Your input for the perfect computer!

I'm the long time user of the Amstrad CPC and runs a online
magazine called 'CPC Oxygen' at www.cpcoxygen.net which is totally free to
view online which also contains past issues of Amstrad Action (with
permission
from Future publishing).

What does this got to do with the 8-bit Atari

Well, we are currently working on a new article for the next issue (Summer
03) discussing what would be the perfect computer, in terms of operating
system, hardware, design, style, price etc. with current or near-future
technology etc and we like to get the input from as many users of
alternative computers and operating systems as possible.

We're looking for anything from full blown thousand words essay to just a
few lines or even a graphical drawing. Even just an innovative idea (such as
having the OS on a ROM cart, with only drivers and other modifications
located on hard drive, allowing for easy upgrade and reducing piracy) would
be great. Basically anything you want.

It you that decides what direction the article takes, perhaps the perfect
computer is already with us, if so why?

So basically any input would be great :-)

Once the article is put together it will pit not only onto the next issue of
CPC Oxygen but any other online magazine/website/publication that request it
(as long as credits remains) as it will be of interest to many fans of
alternative computing.

Forward your ideas, text, drawings to johnkavanagh@cpcoxygen.net

Thanks,

John Kavanagh
Editor
CPC Oxygen

Don't kid yourself, it ain't gonna happen. If they had to bring
someone else in to create the little joystick thingy, they're not gonna
be able to create a console anywhere close to the PS2, GC or Xbox.
What will sell product now is the name, not the fact that Atari made
lots of 8-bit consoles and computers. No-one cares about that anymore.

Absolutely. My favorite game then, my favorite game now. That, and the red
hair I used to have back then that sadly now has aged to auburn. :-(

Started using it on AtariAge when it switched over from being 2600 Nexus and
it has basically become my Internet identity. As far as I know there is no
one else who uses it, so if you see a "Rhindle" somewhere, it's probably me.

I'm sorry, did you think it was a philanthropic organization? Of course it wasn't *just* a game company, it was the *best* game company. But still, a game company.

> How would you like it if some guy grabbed a camcorder and re-did Plan 9
> From Outer Space in his back yard because he wanted to "continue the
> tradition" of Ed Wood, who was nothing more than some guy who made bad
> movies?

Well, the fact people still talk about him proves he's more than that. And people have "continued the tradition", both authorized and not, with varying degrees of success. Check my Site, in the "Beyond Ed" section. Quite a lovely thing, I think. That people would want to bring forth more of Ed's work now that he can't.

>I don't think that would sit too well.

There are, of course, those who agree with that sentiment. I'm not one of them. Only shameless latchings on like "Barely Legal Lesbian Vampires" annoy me. Real attempts to bring new works of Ed's to the public are always welcomed by me.

>To debase something by
> perpetuating the myth that it really was as one-dimensional as it
> seemed is NOT "respect".

Not sure I understand this point, but maybe I do. In the case of one Ed-related film, "Devil Girls", the filmmaker purposely did things wrong, like had scenes out of synch and had the film break. This *was* annoying and *did* seem to insult Ed by doing things on purpose that Ed would never have done intentionally.

But I fail to see how this relates to the issue at hand. The new Atari isn't debasing the old. What would be the point of that? If you are talking about the recent "video game history is HISTORY" line, that's really getting blown out of proportion. One of the main problems facing Atari is

that most people still think of it as being a name from the 70s and 80s. Atari wants to let people who don't already know that Atari's place in history is now no longer settled. Atari is alive and well and has games for them to play.

The main problem with your Ed analogy, though, is that Ed was a person. Atari, no matter how we may have loved it, was always a company. It didn't stop existing when Nolan sold it to Warners. Nor when he left. Nor when it was split in two.

But Atari *did* die. Twice, in fact. The first death occurred with the JTS merger. JTS was not a video game company and had no intention of becoming one. Atari Corp. died and was reduced to a bundle of assets to be bought by Hasbro, then by Infogrames.

The second death was when Midway closed Midway Games West. Midway Games West, as you should know, had been Atari Games Corp. for many years. Passing from parent company to parent company, but always making arcade games. When Midway got out of the arcade business, the by then renamed Midway Games West really became superfluous. Atari Games Corp. is now reduced to what Atari Corp. was: a bundle of assets (in this case, owned by Midway).

And now Atari is reborn. The new Atari is what, at heart, the original Atari was: a video game company. Hardware was the main route the old Atari took because in those pre-Activision days, no one thought any other way was possible.

It's funny how the notion of the new Atari going into hardware is always the first thing people think of when they hear the news about the name change. But to me, Atari wasn't mainly about the 2600 or the 8-bits. The 2600 is my favorite console at least equally because of Activision as because of Atari. Atari to me was about "Asteroids" and "Adventure" and "Missile Command" and "Star Raiders": the games. And not just the originals. An important part of the old Atari were those licensed games: "Raiders of the Lost Ark", "Superman", and, yes, "E.T." And not just the games for Atari systems. "Donkey Kong" or "Defender" on the C64 or TI-99 4/A. "Centipede" on a VIC-20.

And the new Atari is *that* Atari. Not the one that dominated the console and arcade worlds, but the one that makes all those games. All those different games. Racers, fighters, RPGs, shooters, kid's games, etc., etc., etc.

Infogrames spent twenty years building up a solid reputation in the gaming world. They've had their share of crap, of course, but generally they are respected. Throwing away a name you've spent years building to take on the name of another, I think, shows tremendous respect.

I'm rambling on here. I don't think I can convince you to see this from a different perspective, so I'll just agree to disagree with you on this.

I certainly agree with the idea that Atari will not be making any kind of
console or computer. I don't agree that they *couldn't* (theoretically
anyone *could* make hardware, you just need the right design partners) but
that they won't. Unless you're Nintendo, there's no money to be made in
hardware. And Atari doesn't have the kind of bankroll to even think about
trying such a thing.

But could you see *something*? Well, maybe. Gizmos and wacky little
handheld thingies are very popular these days. Heck, that Atari joystick
got almost universally lukewarm reviews and sold like crazy. I could see
Atari doing something like that. Partnering with a company to make a
doohickey to play either old games or new games based on their current
series. I'd be surprised not to see some Atari branded LCD games (beyond
those titles MGA keeps recycling) or more self-contained units like the
joystick.

Source record: 20922

Ok, I'm a little confused by this, but I was hoping that someone may know what kind of beast I've gotten hold of.

I just acquired a very weird looking disk drive setup from a friend of mine who works at a college and found some old computer hardware they had in boxes. It has no identifying marks on it, but it has two 5.25" drives in it. I examined it and immediately realized that it's a drive for an Atari by it's I/O port, but I've never seen/heard of this one before. I tossed in a couple of floppies I had no important data on and tried to boot it. It will not boot any DS disk, but it will boot from any single sided disk. It appears to be in good condition aside from a scratch on the left side. Looks rather cumbersome though.

It's tan (almost a yellow), stacked drives, with a weird locking mechanism that you pull down and then out to lock the disks in place.

I know that isn't too much information to work with, but at least it may be enough for someone to ID it.

Thanks a lot,

I really don't think you're getting the point, or you simply choose to
ignore it because it doesn't support your opinion. I think Curt Vendel
would have something to say about the issue, and it would probably be
closer to my point of view than yours. Regardless, if you're just
gonna do games, you might as well call it Syzygy, because that was just
a game company, and while their best games were made under the ATARI
name, "ATARI" grew to be much more than just a game company, in spite
of the fact that all they're remembered for now is games. Similarly,
Ed Wood is only remembered for making bad movies, and I think you'd
have a problem with anyone who said that's all he was.

Call Infogrames "ATARI Lite" or "ATARI stage one", hell, even "ATARI
Games" (Grames?), but the ATARI of today is but a lingering shadow of
what ATARI once was. I should point out that I'm glad that shadow is
still there, but I think there's a very good reason some people are
expecting them to go into the hardware field, which I doubt will ever
happen again, much like poor SEGA.

Not to be pessimistic here, but I doubt we'll even see Joystick II,
although something that plays 5200 games would be nice. Still, would
anyone in their right mind (in the key demographic, anyway) buy
something that looked even remotely like a 5200 joystick? What would
the warranty be on that -- "guaranteed to break or your money back"???
I can see it now... "ATARI 5200 10-in-1 'joystick' TV game -- with
authentic 'intermittent operation' mode".

Indeed. Atari as it is now is nothing to do with Atari as we knew it. The
staff, building, products are all long gone. All they have done is bought
a name and a bunch of patents/licences and used it to rebrand an existing
and very successful company (no 2 behind EA I believe). To believe it is
anything else is foolishness and delusion.

How big is it (apx LxWxH)? Half-height drives? If it's real big (and very
long -- maybe 18") it might be a Micro Mainframe.
Z-80 processor in it, big PCB, 1797 FDC (IIRC).
Larry

Sounds as if it could be an 815 disk drive. I bit of a rare item i belive (well i've not seen one in the UK)

i have an 810 which has a simmilar drive door to what i think you are describing, the case, a yellowish tan colour sounds right. It is a reletive monster of a drive in size, but only single sided, single density. The 815 was a stacked version, that is it has two drives, one on top of the other.

I understand a small quantity were made, but the price of floppy drives then made it beyond most peoples reach so only a very few were made (you can almost consider it as a made for order item).

Hehe... It hasn't been since some time in the last millenium. ;)

I agree with both sides:

1. It's good to see the name alive, even though it is just the name,
and not really the heart. I think it was more depressing back when
JTS had it; even when Hasbro had it, they weren't doing anything
good with it.

2. On the other hand, it almost definitely will never be where it was
'back in the day,' which is still sad... but again, not AS sad as when
it first died and got sucked up by JTS. (How the hell did THAT happen,
anyway!?)

Hello Bill,

How did it happen? I figure you asked a rhetorical question, but just in case you didn't:

The owner couldn't see past his nose that "Power Without The Price," and, "Business Is War," didn't make for good products. Meantime, other companies that did believe in such basics as quality products, delivering when promised, etc., jumped ahead. When the situation had deteriorated to the point that the company couldn't be sold, it was simply absorbed into one of the owner's other investments.

I have no illusions about the current Atari producing hardware. Sure, it would be nice, but ...

Meantime, the name, at least, is alive and doing well selling games.

Take care.

Alan

A friend of mine also got one. I think it is a Percom or something
aftermarket drive setup? This one did not work though. These are rare but
junk really.

I have the Astra 2001 dual drive system single sided but true double density
stacked, but in a single enclosure to save space. Uses motors and not
fanbelts so they are very reliable and still work flawlessy to this day. A
truly great buy and value.

What he has doesn't sound like it, I think Percom are the guys who made the
Astra?

Atari was a public company traded on AMEX, had a positive balance sheet with cash on hand, but no selling product and no serious product in development.

JTS wanted to go public, but instead of doing the usual IPO thing they arranged with the Tramiels to be purchased by Atari Corp.

So Atari bought JTS, then the resulting entity was named JTS. Thus we all learned of the "reverse merger" maneuver.

If you weren't talking to the rest of the group, this should have been sent in private email. Otherwise, sport, any comments posted in a public unmoderated newsgroup are fair game for replies, thoughts, flames, insults, and accusations.

Panks's repetetive posts about his IRC channel are annoying, but yelling at him is going to do about as much good as ignoring them - none. And if you respond to an off-topic post, all you are doing is propagating it, and wasting more bandwidth and time.

Furthermore, from what I've seen, you had no basis upon which to criticize him for this post. In all of the groups I see in the headers here, it was on-topic. Can't you laugh at something written by someone you don't like?

Grow up, learn to use a killfile, and understand that usenet (unless otherwise specified) is an unmoderated medium. Your childish insults are not helping anything.

Sincerely,
--Decimal Cat

Nah, mommy doesn't control his internet usage anymore since I got him
kicked out of his house. I'd again like to note how I am the most evil
man alive. 8*) BTW, if anyone wants to hear the story of how I got
Paul kicked out of his house send me an e-mail, it's a good story. 8*)

Reminds me of that Mad Magazine issue. .

When you're kids: "My dad can beat up your dad!" "Yeah, when and where?!"
When you're adults: "I've got the best lawyer in the county, I'll sue you!"
"Yeah, well, bring it, I've got the best lawyer in the STATE!"

Message-ID: <XSqKa.95$Py2.2132@news-server.bigpond.net.au>
Source record: 20751

Doe's anybody know where I can get a 600XL schematic? I'm re-building an old one that has had all it's chips pulled. Or could some body tell me what U14, U7, U19, U24, U17, U9, U10, U21, and U20 are?

Thank's again

Mark

PS will upgrade this to 64k then 1088k when repair is complete:-)

I hate to go against the flow, but why is there so much animosity against this fellow? All he is doing is trying to kick off a forum for IF fans to mingle. Is it really such a bother to all of the nay-sayers that they have to slam him on an open news group? So far Mr. Panks has been nothing but civil here. Why not afford him the same courtesy? If you don't like his channel, don't go there and keep the negativity to yourself. I'm not trying to pick a fight here, just intermediate.

THanks for listening.

This may well be the case. Quite possibly none of your children will
see the inside of a "psycho ward" either. And by the time any of your
grandchildren might need mental health services, one hopes that "psycho
wards" will no longer be needed at all.

Well, my friend found the manual to this drive and brought it to me today.
BTW: I did forget to mention that it had half height drives.

Anyways, it is an Astra 1620. I had never heard of these before now. I'll probably get rid of it, though. I have four 1050 drives and they have all been upgraded to "Happy" drives... (I look back now and I think it's a little bit crazy that I bought more than two of them in the first place...)

Oh, well. Thanks, guys.

You're going to have to start actually making a point if you want me to get
it. You say the name change is "hype". You don't explain why. You say
there won't be a "Joystick II", but give no justification. I can't say I've
noticed any point to ignore.

> I think Curt Vendel
> would have something to say about the issue, and it would probably be
> closer to my point of view than yours.

I'm sorry, am I supposed to feel bad about that, if true? Has Curt Vendel
become the end-all be-all of Atari? If so, I didn't get the memo. I
respect him for all he's done, but his opinion is still just one man's
opinion, like yours or mine. And please don't throw someone else's weight
around unless you know what his opinion is.

> Regardless, if you're just
> gonna do games, you might as well call it Syzygy, because that was just
> a game company, and while their best games were made under the ATARI
> name, "ATARI" grew to be much more than just a game company, in spite
> of the fact that all they're remembered for now is games.

You're really going to have to explain this point of view sometime. Atari
is and was a video game company. What makes you think it was something
more?

> Similarly,
> Ed Wood is only remembered for making bad movies, and I think you'd
> have a problem with anyone who said that's all he was.

Again, I don't see how your analogy works. Ed isn't *only* remembered for
making bad movies. Especially thanks to the movie, he's also remembered as

a maverick, heart-felt filmmaker. Of course, he's *mostly* remembered for making bad movies, but that's not nearly the same thing. And, no, I wouldn't have a "problem" with anyone who said that's all he was. If I did, I'd have a "problem" with most of his fans! I may disagree and I may try to educate, but I realize that Ed's fans (like Atari's) all come at it from their own angle.

> Call Infogrames "ATARI Lite" or "ATARI stage one", hell, even "ATARI
> Games" (Grames?), but the ATARI of today is but a lingering shadow of
> what ATARI once was.

Well, obviously. But the Atari of 1996 was too, and nobody acted like they weren't Atari.

> I should point out that I'm glad that shadow is
> still there, but I think there's a very good reason some people are
> expecting them to go into the hardware field, which I doubt will ever
> happen again, much like poor SEGA.

Why poor Sega? Do you realize the company is profitable for the first time in years? It *is* too bad they had to get out of hardware, but that's just the way it goes. At least now, Sega will continue to make games, which is what they are really all about. Remember, Sega made games for the 2600 and other systems before they got into consoles.

What you don't seem to get is that companies change. Sometimes they have to. Atari went through a strange period before rising from the ashes. Sega had a bit of a harder road, in some ways. It had to go through it's painful transition under the glaring spotlight of an industry it once dominated. Atari did it in the dim shadow of obscurity.

Anyway, I really am tiring of this. Unless you've got something substantial and new to add, I'm off.

I think those lame people who flames Paul Allen Panks without any
obvious reason simply don't appreciate the fact that he entitled this
channel #WFPC in reference to his website and projects (Westfront PC).
They probably don't like also that he programmed many games, and
releases them for free because they've never designed one in their
life, or they prefer modern ("cool") games.

# 3618. Re: help copying disks to unix machine

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-26 15:50:12 UTC
From: Bob Woolley <ataribobdelete@alamedanet.net>
Message-ID: <3efb1a82$0$24486$2c56edd9@news.cablerocket.com>
Source record: 20781

You cannot use metal filings to develop the data on a diskette... you need tape developer, ferrite suspended in tape cleaner. Just cut the disk out of the jacket and dip it in a pan of developer. Let the disk dry (only takes a second - blow gently on it) and the bits will be visible on the surface. The hard part with an Atari disk is that it does not use Index so you have to scan all over the track for the MAM and Index Flag. You will discover that the track is laid out as a standard IBM System 34 format. Be sure to clean off the ferrite with tape cleaner before you try to read the disk in a drive!

Regardless of the destination, you will have to read the data on an Atari drive somewhere. Borrow a drive from one of us.

Bob

>And now Atari is reborn. The new Atari is what, at heart, the original
>Atari was: a video game company.

The one thing everyone in this thread seems to keep missing is that Atari was founded as a coin-op company. I've never read anything saying Nolan Bushnell ever had any idea of getting into the barely existent home video game market when he founded Atari. IIRC (and I may not), it was one of his employees that came forward with the idea to create a home Pong console. Atari had to have backing by Sears to do that. Then they needed the capital of Warner Communications to get the 2600 out the door.

So which Atari do you mourn for?

a) Atari, Inc., founded as a coin-op manufacturer, but later getting involved in pinball machines and dedicated home consoles.

b) Atari, Inc., a subsidiary of Warner Communications, which took the Atari 2600 unprecedented heights and brought us the Atari home computer line while continuing to create top-notch coin-ops.

c) Atari Corp., bought by Jack Tramiel and intended to be mainly a computer company, but grudgingly made home consoles because that's where they money was.

d) Atari Games, which continued creating innovative coin-ops while owned primarily by Warner, Namco, Warner, Time-Warner (became part of Time-Warner Interactive), WMS, and finally Midway. Midway eventually renamed it Midway Games West before exiting the coin-op business.

e) Atari, a label of Hasbro Interactive. (Rescued from JTS after JTS and Atari Corp.'s "reverse merger.")

On r.g.v.c, the predominant opionion seems to be b. It may be c on the comp.sys.atari.* newsgroups.

Chuck,

At first, it looked like your "victory" in kicking me out was
complete. However, now that I am on my own, and working, and dating
again, I have to thank you. That phone call improved my love life
exponentially. The victory, then, is mine:

"Weaseling out of things is important to learn. It's what separates us
from the animals... Except the weasel." - Homer Simpson

Sincerely,

Paul Allen Panks

Glad to be of help. BTW playing and winning ultima 3 on my atari 800 was and
still is my best computer gaming experience of all time.

:)

My killfile takes up about half of my harddiskspace, and with 98% off-topic and flamewar postings, it's time for me to leave again.
I've never seen a more annoying newsgroup then csa8bit lately is.

If this is what's left of Atari, o.k. for me, but also without me...

> noticed any point to ignore.

Simple. Because this new "ATARI" is a software company, not a hardware
company. THAT is the difference I'm trying to point out to you.

> I'm sorry, am I supposed to feel bad about that, if true? Has Curt Vendel
> become the end-all be-all of Atari? If so, I didn't get the memo. I
> respect him for all he's done, but his opinion is still just one man's

> around unless you know what his opinion is.

I'm just saying that he seems to respect the legacy of ATARI, and that
included a lot more than just games. The consoles themselves and even
the computers are not unnecessary parts of the company that can easily
be overlooked, but that's just what you're choosing to do.

> You're really going to have to explain this point of view sometime. Atari
> is and was a video game company. What makes you think it was something
> more?

I think I've sufficiently explained above, but at the most basic level,
it's that ATARI wasn't just a software company like Infogrames is/was.
Pardon me for confusing you, but to me, a video game is software.

> Again, I don't see how your analogy works. Ed isn't *only* remembered for
> making bad movies. Especially thanks to the movie, he's also remembered as

> I'd have a "problem" with most of his fans! I may disagree and I may try to
> educate, but I realize that Ed's fans (like Atari's) all come at it from
> their own angle.

Well, you obviously don't really care much about the man's legacy. In
other words, it's like saying that George Washington was that dude who
chopped down the cherry tree, Abraham Lincoln was an avid theatre-goer,
and that Bill Clinton was just Monica Lewinsky's boyfriend. For a
software-only company to assume the mantle of ATARI is an insult to all
the great hardware that bore the name, whether it was developed
in-house or not.

> Well, obviously. But the Atari of 1996 was too, and nobody acted like they
> weren't Atari.

And who was the ATARI of 1996? I don't recall there being a company
with that name then, only that Hasbro stuck the name on their "classic"
releases. I don't have a problem with that, because Hasbro didn't try
to change their name to ATARI.

> Why poor Sega? Do you realize the company is profitable for the first time
> in years? It *is* too bad they had to get out of hardware, but that's just
> the way it goes. At least now, Sega will continue to make games, which is
> what they are really all about. Remember, Sega made games for the 2600 and
> other systems before they got into consoles.

Wow, I learn more about you with every post. If the 2600 and those
other systems weren't consoles, what the fuck were they???

> What you don't seem to get is that companies change. Sometimes they have
> to. Atari went through a strange period before rising from the ashes. Sega
> had a bit of a harder road, in some ways. It had to go through it's painful
> transition under the glaring spotlight of an industry it once dominated.
> Atari did it in the dim shadow of obscurity.

To my knowledge, SEGA is still SEGA. ATARI all but died, yet
Infogrames is now pretending to *be* ATARI simply because they own the
trademark. I'm sure they're counting on no-one having any idea that
they aren't the company that produced the 2600. It's like someone
putting out a line of PCs under the AMIGA name. Sure, Gateway owns the
name (or at least they did at one point), but it wouldn't really be an
AMIGA.

> Anyway, I really am tiring of this. Unless you've got something substantial
> and new to add, I'm off.

Done with our trolling, are we? Well, I'm sure you won't consider my
clarifications above to be substantial, so feel free to be on your way.

Okay, so when is the next "ATARI" coin-op coming out?

> e) Atari, a label of Hasbro Interactive.

Exactly. A *label* of Hasbro Interactive, which was itself a division
of Hasbro. Up until now, ATARI has been a *label* of Infogrames. Now
they want to name the *company* "ATARI". THAT is my definition of
hype.

I have one. Sometimes it wouldn't boot up, or it would run really slow, or sometimes it would just quit in the middle of a game. Just the other day I found that after a week of not wanting to run, it had deleted itself. Wow, Paul really puts a lot of himself in these games, doesn't he?

Sega is still Sega, but do I really care? Not much. I liked their games,
but I liked their platforms more.

Like it or not, "Atari" is whoever owns the rights to the name and
trademarks and all. It's no longer a "pick up where the other's left off"
game, like it was with the Tramiel's. It's a "we want the namesake and to
build it back to popularity" game. But... Infogrames, having changed their
name TO Atari is now *fully and entirely responsible* to all that name has
ever meant, as well, what little it means today. This is why I think that
they have put themselves in a much more potential position than ever before.
I am reasonably certain, with a little bit of prep-work and planning, and
team work, we might well be able to "coerce" Atari, Inc. into selling
computers again... but, if nothing else, writing software for their new
computers would be a natural move, since they already do software, games,
and such.

We do all the prototype work FOR them and then present it TO them, with a
suitable business plan and strategy. It's money we'd have to spend to get
it done, but if they said yes... wouldn't the end result actually be worth
it? It would be for me.

A wee bit behind the "Amiga Times", are we? "Amiga" (and all it
represented) was sold to some people, who now call themselves "Amiga, Inc.".
The AmigaOne (the new PowerPC-based motherboard/system) is available, but
AmigaOS 4 (based on the AmigaOS 3.x sourcecode, but rewritten for PowerPC)
is still being worked on. Amiga, Inc. is having some rough times
financially, but the AmigaOne and AmigaOS 4 were farmed out to 3rd party
companies, so that, if anything happens to Amiga, Inc. (many predict doom,
as Amiga's legacy seems to be nothing but, since the day Commodore went
belly-up), it won't affect the AOne and AmigaOS4 directly. This is, quite
simply, the smartest move by ANYONE who has taken on the Amiga mantle since
Commodore's demise. I applaud them for looking ahead (prepare for the
worst, but hope for the best) and thinking of the user's for once.

Go to: www.amiga.com (main company), www.amiga.org (enthusiast site), or some other sites for the latest...

Luposian

It used to be a nice place without a lot of flames and fighting and anonymous sicko trolls. I would brag about how positive and easy going CSA.8bit was in other computer newsgroups where there was a lot of fighting. Oh well.

The anonymous remailers really do a disservice to people. I used to ponder the question of whether there was any legitimacy to anonymous speech and decided that there was, because governments can be oppressive. However then you get these awful abuses where the anonymous hero posts daily to call his target a pedophile, or accuse him of bestiality, or just spew profanity and the like. But the target has the ultimate revenge because the anonymous loser still has to live his own cruddy life.

As for the flames, I don't like them either. Who needs this type of thing. The Beatles sang that "life is very short, and there's no time, for fussing and fighting..."

Reasonably certain???? HAHAHAHAHAHA. What computer is this then? even long established computer manufacturers have gone tits up, or had to merge with other large companies just to stay alive. Compaq and HP anyone? Where the hell is some 2-bit software house like infrogrammes gonna get the money or backing to even re-sell a re-badged PC?

I think its time you took the pink sunglasses off.

> Okay, so when is the next "ATARI" coin-op coming out?

Not sure if... if ever. If "Atari, Inc." owns (or somehow reaquired) the arcade rights to the Atari Games division, then I think it might be possible. What if we designed a new arcade system and had "Atari, Inc." write the games for it? Hmm...

> > e) Atari, a label of Hasbro Interactive.
>
> Exactly. A *label* of Hasbro Interactive, which was itself a division
> of Hasbro. Up until now, ATARI has been a *label* of Infogrames. Now
> they want to name the *company* "ATARI". THAT is my definition of
> hype.

The Atari *label* within the company ("Infogrames sells 'Atari' games"), has now been taken on as the *banner* that the company now trumpets under ("Atari, Inc. sells games"). Unfortunately, the box for Enter the Matrix doesn't reflect this namechange, but I imagine the next ones will.

It does bring some sense of satisfaction that Infogrames saw fit to restore Atari as a business (never would've expected such a drastic change as this, but...), even if that business is just writing games for PC's and home consoles.

They are now going to be responsible for what they do and how they do it. "Atari" is no longer just a trinket in their pocket (or anyone elses) to try and make some money. THEY are now the trinket and, in so transforming INTO the trinket... make the trinket into a substantial PRIZE!

Think about it... it they sell out... the next owner are merging with/buying Atari, Inc.! It holds more weight and water than if Infogrames just tosses a buying company the "Atari assets". Or, if Infogrames were to go belly up, the Atari assets might well be the only thing the buyers want, leaving Infogrames to rot in their misfortune, while the new looters take the only "name" really worth much... And the cycle of doom and gloom goes on. I think Infogrames wants/wanted to break the cycle of "whoring off the bitch" as just a singular "asset" within a company. "Atari" means less to EVERYONE when it's just a name passed around like so much unwanted pocket change. They've now increased the value of "Atari" substancially. "You wanna buy "Atari"? You gotta buy EVERYTHING!" And that's gonna be a whole lotta hundred millions now!

No one can predict what may happen in the future, but this may be a subtle (but drastic) manuver to insure Atari's survival as a company! As Amiga, Inc. has insured the safety of the assets of the "Amiga", by farming out the techologies to 3rd party companies, so Infogrames saw fit to *become* Atari, Inc. to insure that, should anything happen, Atari would be not only worth more, since it's now an entire, vast company, but also MIGHT be put back into the hardware business someday!

Infogrames may have actually had the desire TO make Atari a hardware company again, but have not the finances nor facilities to do so. Thus, they change their name (and all underlying branches, subsidiaries, etc.) TO Atari, Inc. and, in so doing, make the name well known again (in time; the name *has* languished and whithered a good long while) and, should finances permit or a buyout be emminant, the likelihood of making Atari, Inc. into a hardware company again might well be far more possible! Were I in Infogrames position (with the money and ownership of the Atari rights, I'd do the same thing, in the hopes of achieving a higher goal than just selling more software titles). Stick "Atari" far enough out into the sunlight, and EVERYONE is gonna see it eventually. Fathers will tell of the good old days. And children will play/use the older things of by-gone days. And, possibly... just possibly... what is old will be new again!

Let's hope that Infogrames is doing the "namechange thing" for more noble reasons than just to milk the namesake into their coffers.

The namechange we've witnessed could well be but the first big step towards a new beginning of Atari, since the end of the "Tramiel Squander Age"! It's something to hope for, isn't it?

Luposian

Exactly. Such is the case with ATARI in a lot of people's minds,
myself included.

> Like it or not, "Atari" is whoever owns the rights to the name and
> trademarks and all. It's no longer a "pick up where the other's left off"
> game, like it was with the Tramiel's.

Well, the thing is, the Tramiels bought the company, moved in, fired
80% of the workforce, and kept going. However, ATARI was nothing more
than a brand name for years, so while Infogrames has every right to the
name, I'm just saying that it's pretty hollow.

> This is why I think that
> they have put themselves in a much more potential position than ever

> computers again... but, if nothing else, writing software for their new
> computers would be a natural move, since they already do software,
> games,
> and such.

Wow, you are beyond delusional. I wonder if this is the reaction
Infogrames was counting on, or even expected. Right now, the Mac and
the PC are the only two personal computer platforms, and I don't see
that changing. As much shit as Mac users get for not using Windows, I
really don't think the market would support a third platform. Hell,
even Linux is just an OS that runs on existing hardware, not a whole
new platform. Forget about the days when there were five different
computer platforms, those days are over. Besides, all we ever wished
for back then was to be able to run each other's software on our
different machines, anyway. Now that Windows dominates the
marketplace, compatibility is now a non-issue. We got our wish, but I
dare say we didn't exactly get the best possible outcome.

> A wee bit behind the "Amiga Times", are we?

Yeah, well, after a brief flirtation with PCs (more like a torture session), I switched to Macs after my A1200 wouldn't cut it anymore (basically I discovered MAME, and 28MHz wasn't even fast enough to run older games under the Amiga version). I do remember hearing about AmigaOne, etc., but never seriously considered keeping up with these new Amigas. From what I saw before everyone around here stopped carrying Amiga magazines, every complaint PC users had about the price of Macs vs. what you get was actually true of the new Amiga machines.

I'll check out the site and see what they're up to.

Dude, you really need to wake up. Even if Infogrames does decide to
sell the ATARI properties (and they WILL if they are hurting enough
financially), I'm pretty sure they'd change their name again and keep
on going rather than allowing the entire company to be bought out.

Look at how much skepticism Microsoft's attempt to enter the console
wars was met with -- and that was MICROSOFT! However, the Xbox has
proven successful enough that it might be possible for ATARI to
introduce another console. My opinion is that they don't have anywhere
near the resources to do that, and if there is ever another ATARI
console, it will most likely be a "licensed" product like the LYNX
rather than an in-house thing like the 2600. You never know, maybe
when Bill Gates tires of the Xbox, he might sell the rights to ATARI.
It already kinda looks like an ATARI product, doesn't it?

Possibly or patch a trace with that silvery paint stuff; I would have to verify that the XL/XE has the same matrix as the 400/800 where C, D, E, and 3 are on the same branch (#14). You might look very closely where the mylar plugs into the mother board. Interestingly, zero, P, colon, and ] are also on 14; what is thei status..? If only the left side is out, you have a clue to finding the break.

Never. (Or whenever Midway either decides to start using the Atari
name in arcades again or sells those assets to someone else who does.)
What's your point? Mine was that many here are bemoaning the loss
of Atari consoles and computers, but that's not what Atari was
originally founded for.

And if Atari as a (PC) software company bothers you, I have four
words for you: AtariSoft and Atari Interactive. The former was
Atari's mid-80s effort to primarily cash in on the home computer
market. The latter was Atari Corp.'s last gasp before the
reverse-merger with JTS.

"boot up..." ? Are you talking of your computer ?
The only criticism I could do to most of Paul's games is that they are
with a black background and white text while I prefer the opposite,
but otherwise all the ones I have (I've d/l 5-6 of them) run fine.
Yes, I think he's dedicated to his passion to program int-fiction
games and share his interest for them, in the same manner you're
dedicated to easily flame other people on newsgroup and share your
uninterest. I just hope you don't put a lot of yourself in this task,
or you're not like that in the real life, it'd be a pity to be such...

Max,

Guess what? All of my games work fine. Go on over to google.com, do a
search for "Westfront PC: The Trials of Guilder" and download my game.
It will work. If you have Windows, that is.

Sincerely,

Paul Panks

I tried that game, and everything I tried to do it said I
was not able to do that and I had to keep going back.
I got absolutely nowhere fast so I uninstalled and
deleted it.

I have sales figures for Commodore 64 (C64) and Amiga, as released by Commodore before they went bust.

Concerning the C64, it holds the "Guinness Book Of Records" (not sure, which edition) record for best-selling computer of all-time with estimated sales of 30 million from 1982 till 1993.

> B) Apple II series

Again, I got a brochure from Apple computer which estimates sales of 5 million Apple II's covering 1977 till 1993. Everything else, would be far below that, largely due to a shorter product lifespan.

Heh, a little exaggerating surely. By the way, which computer or
game console has seen the largest drop in list price? IIRC, the
TI-99/4 was released at $1150 in 1979, and the improved TI-99/4A
was down at $99 in 1983ish when it finally was dropped.

That's because of the great computer/video market crash of 1983, when
alot of companies went under!

I've completed The Goonies.
I thought it was really good. I used infinite lives, as I thought the
game was really hard.
I liked the puzzles, especially the last screen; with the ship.
Good graphics, good puzzles, good music.
- Robert.

That TI apparently didn't have a clue about how to sell computers didn't
help much, either. Also, while the computer was fairly cheap (my first
machine was a TI-99/4A purchased in early 1983 for (IIRC) about $150),
add-ons remained expen$ive. The cost of upgrading it to make it useful for
more than just games and tinkering around in BASIC led to it getting
replaced by an Apple IIe in mid-1985.

(I now have a 99/4A with all of the stuff that I didn't have back in the
day--48K, Extended BASIC, floppy drive, speech synth, etc. I think I have
no more than $100 in it. eBay 0wnz j00. :-) )

Actually, the crash was the following year, 1984.

TI pulled the 99/4a because they were losing huge wads of cash on the machine, selling it far below it's value, hoping to make it all back on the PE BOX and the various things to stuff into it. Then, the straw that broke the camel's back: The Coleco ADAM was announced in the spring of 1983. $600 for a 64K (80K with video RAM - compare the 99/4a which ONLY had the 16K of video RAM!), a fast reliable random access tape system, and a letter quality daisy wheel printer with included word processing software. TI couldn't compete. Coleco hoped that no one could. But Coleco released it before the engineers were finished making the thing work reliably. Death to two systems.

Part of the problem Scott, was that TI sold VERY expensive mini
computers that used the same CPU as the 99/4a, and that division didn't
want to see people buying the 99/4a for a few hundred bucks and then
using it to run the software that ran on their $25,000 systems.

Can I ask you a question?

If so many deride you for advertising on this newsgroup and call you gay and such, why do you advertise here?

Are you recieving sufficient orders for stuff to warrant the "personal war" against you that goes on? If so, then, great. But if not, seems a bit of a waste of time and energy.

Just a thought.

By the way... if you have an empty 1040ST case (with power supply and keyboard only), let me know what you want for it, plus shipping to 85635. I'm looking to create an interesting project later on down the road.

Do you think Ben should back down from the cowards?
Most folks see the harassers for what they are.

Ben provides a service to those who use the Atari Computers of which sources
for hardware and software are getting pretty scarce these days.

The mere annoucement of the Coleco ADAM caused the death of TI (and others no doubt) in 1984.

Hmm.. well, we Commodore users surely thank God daily for Coleco's mercy on us during that time.

Actually, it was the year after that -- 1985. I remember because of
Live Aid. :p

(One computer magazine cartoon postulated the rescue of a certain
company by way of a "Clive Aid" event...)

Hello Bill,

Sorry you had a bad experience. The game isn't very easy to play,
which is my fault, but I did try to include instructions within the
game that had examples on how to play. There is also an extensive
walkthrough with specific screenshots from the game available at:

http://members.tripod.com/~panks/wftrans.html

The page takes awhile to load, as there are over 65 screenshots from
the game on the page.

Let me know if this is helpful.

Sincerely,

Paul Allen Panks (a/k/a "Dunric")

No, I guess you don't read very well.

1. It was 1983, not 1984 that the Coleco was announced, and the TI died.

2. TI was losing millions already. The Coleco announcement was merely
the "final straw", there was no way TI could put together a bundle like
Coleco did at anywhere near $600 and still make money.

>
> Hmm.. well, we Commodore users surely thank God daily for Coleco's mercy on us
> during that time.

Consumer's Reports did a comparison of the Coleco, C-64, TRS-80 CoCo and
Atari 600XL.

The Atari won.

But the reason they did the comparison was because of the Coleco bundle.

The C-64 couldn't touch the Coleco, because at the price they had only a
VERY poor DMP, and their infamous tape system.

And it wasn't Coleco's "mercy", it was the toy company's incompetence in
selling such a complex, expensive machine. By the time the bugs were
worked out, no one would touch the machine. That, and the video
game/home computer shake out caused Coleco to pull the machine in

January 1985, less than 18 months after going on the market.

I never saw it spelled that way. I'm up for being corrected though if you find a source that says Adolph.

Hello,

What is your favorite musical score in classic video games? For me, Gyruss is the top of the mountain. That musical score is hypnotically heteroclitic, aberrantly anomalous and capriciously conspicuous. In other words, values, symbols, and terminations, that is one hell of a sound track.

Sincerely,

Paul Allen Panks (a/k/a "Dunric")

Yeah, but you also probably like the soundtrack from "Sybil".

Couldn't pick just ome,,, Some of the Commodore 64 scores I like:
Rambo(really give a good example of the SID's quality)
Master of Magic
Agent USA (nicely in time with the game)
Wizard of Wor - Donkey Kong - Dig Dug - gives a good arcade flavor
Times of Lore intro

> (Peddle is God, and Tramiel is his propheteer)

No, firstly the crash STARTED in 1983. Christmas sales that year were
dismal.

Did the Coleco cause TI to pull out? No, the Coleco had a pretty
crappy daisy wheel, with a slow "hi-speed" tape unit and a terrible
Basic (Applesoft compatible that loaded from tape) without an
underlying Apple making it not so compatible. Hey, I have a Coleco, I
know...
TI had already lost money from the start, when the 9985 failed to be
produced so they were required to use the 9900 with static ram to
replace the 9985's on-board 256 byte cache. Then they had to add a 16
to 8 bit multiplexer.
And the original price of about $1150 included a monitor (TV), it
dropped to around $500 when they got approval for the TV modulator.
TI's tactic of selling you the console cheap and hoping you will add
on more expensive peripherals isn't unlike the telecom industry of
today. Sign-up for a 1 or 2 year contract, you get a free phone. They
just didn't realize how cheap (oops, I mean frugal) TI users were/are.

I bought my TI in 1982 for $300, in '83 they were going for half that. $600 for 64k would have been too much. For about $200 in 1983, I added the P-box with 32k and disk drive & controller. I also got a free speech unit for buying some game carts I already wanted. So, in '83 you could have a TI system with 32k + 16k video ram (48k) + disk drive + speech for a mere $350, almost half of a Coleco that had a "hi-speed" tape unit.
And if they hadn't pulled the unit, a hex-bus interface was being released to allow you to add TI's own "hi-speed" tape unit, and cheaper peripherals.

Ben

No. 1983 wasn't that bad. 1984 was poor, and by 1985 "orphan" was
becoming all too come for 8 bit users.

>
> Did the Coleco cause TI to pull out? No, the Coleco had a pretty
> crappy daisy wheel, with a slow "hi-speed" tape unit and a terrible
> Basic (Applesoft compatible that loaded from tape) without an
> underlying Apple making it not so compatible. Hey, I have a Coleco, I
> know...

I have one too. Actually several. I bought my first in 1986. As poor as the daisy wheel was, it was far better than most dot matrix printers of the time (at least the ones attached to C-64s, CoCos, etc.

The tape unit was slow - compared to anyone's disk drive, but far faster than nearly anyone else's tape units, and far more reliable (once the bugs were worked out)

Byte thought the SmartBASIC was one of the best BASICs, and certainly the fastest for any 8 bit machine. It was code compatible with AppleSoft, but that was excluding peek and poke locations.

Again, as you point out - TI was losing millions on the 99/4a. It wasn't so much the ADAM, as the *bundle* and the price that made TI realize they would never get the 99/4a market to make any money. They could never had delivered for c. $600 what Coleco and Atari promised (esp. after Atari released the 800XL) so they would never recover what they lost with the basic machine.

> TI had already lost money from the start, when the 9985 failed to be
> produced so they were required to use the 9900 with static ram to
> replace the 9985's on-board 256 byte cache. Then they had to add a 16
> to 8 bit multiplexer.

The TI 99 used the 9900 from the 70's. And the 9900 was designed to use either 8 or 16 bit memory.

> And the original price of about $1150 included a monitor (TV), it
> dropped to around $500 when they got approval for the TV modulator.
> TI's tactic of selling you the console cheap and hoping you will add
> on more expensive peripherals isn't unlike the telecom industry of
> today. Sign-up for a 1 or 2 year contract, you get a free phone. They
> just didn't realize how cheap (oops, I mean frugal) TI users were/are.
> I bought my TI in 1982 for $300, in '83 they were going for half that.
> $600 for 64k would have been too much. For about $200 in 1983, I added
> the P-box with 32k and disk drive & controller. I also got a free
> speech unit for buying some game carts I already wanted. So, in '83
> you could have a TI system with 32k + 16k video ram (48k) + disk drive
> + speech for a mere $350, almost half of a Coleco that had a
> "hi-speed" tape unit.

All prices quoted from Consumer's Reports, September 1983

TI 99/4a $100
PE Box $250
32K card $300
Total $650

No parallel or serial card
No printer
No word processing software

C-64 $200
Disk drive $399

Total $599

Atari 800 $300
Disk drive $450
Total $750

CR October 1984

Atari 800XL $200
Disk drive $350
Printer $297
Total $847

C-64 $250
disk drive $275
printer $250 (Commodore 1525)
Total $775

As you can see, TI could never have put together a system with printer
and interface for anywhere near what Coleco, Commodore and Atari did.

> And if they hadn't pulled the unit, a hex-bus interface was being
> released to allow you to add TI's own "hi-speed" tape unit, and
> cheaper peripherals.

And if bulls had tits that wouldn't make them cows.

>

At the risk of breaking the "no feeding" rules, I'm posting a humble
request:

Give it a rest.

I don't post in here too often, but some of you know me, and those of
you that do know that I'm generally the last to get involved in flame
wars. This is a great group devoted to a great passtime - is there any
chance we could try leaving it at that? Between your personal vendetta
against the originator of this topic and that other guy who likely runs
around his house yelling "I'm hunting Benny" in the best Elmer Fudd
voice he can muster, the pollution factor here is headed swiftly in the
wrong direction.

Now, back to business... Gyruss has a great sound track. Just the
mention of hit has it running through my head and puts me back in one of
my younger days haunts. Matter of fact, I think I may have to (OT
warning) go play a game of it in MAME.

The C64 does not have a poor DMP, whatever a DMP is. If it has anything to do with display, the VIC (Video Interface Chip) in the C64 was the most advanced display processor available in a low cost home computer in 1983. As for the tape system, at least it worked in a reliable fashion. And, for the $600 price tag you mentioned for the Coleco, by 1984 you could get a C64 and a disk drive.

>And it wasn't Coleco's "mercy", it was the toy company's incompetence in

Coleco just couldn't compete with Commodore I guess. The C64 was alive and well for many years after that.

Right, and the "poor DMP and infamous tape system" sounds like a knock
on Coleco, not Commodore, except that the ADAM printer was a daisywheel
or other form of impact printer, not a dot-matrix. So how exactly do
those two undesirable features mean the C-64 "couldn't touch" the ADAM?

Besides, I think history has shown us which was the more succesful of
the two machines. Wait, let me rephrase that. I think history has
shown us which ONE of the two machines was actually SUCCESSFUL.

Sorry to hijack your post, Bill, but you made a good point about the
"DMP" and I wanted to expand on it. See, I'm not a *total* dickhead.

Hi,

Read the manual you need to convert the jpeg's to greyscale with a program like paintshop pro. (trail version is free). Secondly make the resolution of this jpeg about 320x200 bigger is not usefull because only a part is decoded.
The Quality of this decoder is briliant, I use it to convert pictures to HIP. Very easy...

Color will be supported in the near future.

Maybe progressive packed jpegs also gives problems but I never tryed that...

The incidental music from Galaga still gives me goosebumps... and the
Space Invaders bassline is a classic (minimal but effective).

Well, Commodore also slashed prices of the C64 to mere $300 and the Vic-20 to under $100 ($99). So Commodore was merely competitive to Coleco and in the long run took Coleco out of the water since by 1985/1986 the death of Atari (CBM's last fighting competitor in the low-end computer market) and its resurrection. This was one wild time.

Hi Paul,

what about C64's "Last Ninja 2"? Amazing arrangements.

Flavio

I seriously think it was all a matter of what month. In early 1983, a C64 with disk drive cost $600. In 1982, A c64 cost $600. (w/tape) = $ 700 and with drive was around $750. By Summer 1983, the C64 dropped 20% on price and by Christmas time dropped another 15-16%. This all depended on when the survey was made on the prices and what was compared. I saw the chart but the comparison was made but the comparison was never a clear and true debate. Sounds like fancy term like Chromashadowing. Wow, a little spray paint job. Bunch of fancy words but meant utterly nothing.

I thought CBM had a dot-matrix and it was rather decent. Whole system cost
something like $595 in 1983.

Overall, 1983 wqas ok, but the crash started at Christmas. Software
releases like Atari's ET finally woke the consumer up to what kind of
crap was being turned out.

The TI had a 16-bit databus, it was _not_ designed for 8-bit memories
without a multiplexer circuit.

And you would buy a product without taking advantage of product
promotions?
Ok, take your report of a $100 TI. I got a P-box package for $200
containing the 32k card with the disk drive and controller that summer
as part of a nationwide promotion where you buy the box and get your
choice of two cards free (choose from disk controller, 32k or RS232).
$100 for RS232 card (serial/parallel). $100 for Daisy wheel.
$500 for the full package.
TI-Writer versions could be had for free in 1983 (TK-Writer)...

The hexbus peripherals _were_ released for the CC-40. The hexbus
interface was already prototyped and ready to release.

The TI sold between 2 and 2.5 million units in the four years it
existed as both the 99/4 and 99/4A (1979-1983).

International Karate or World Karate Championship, Warhawk and Jet Set Willy
(game sucks though) all on Atari 8-bit. And I like the power of Ballblazer
with the jazzy theme, lovely. Also when connected to an amp, the Masters of
Time sounds really awesome.

First of all, I am no one to you, as you are to me, and
second, this happens to be a cross post. I am not the trouble-maker,
the people who continuously cross-post are as far as I am concerned.

Gyruss's version of Toccata and Fugue is also a favourite of mine. Also I
liked the version in the pinball game Haunted House.

For my favourite sound effects and music, it's got to be Exidy's Chiller.

Bach will be delighted to know that you enjoyed his Toccata and Fugue in D
Minor...at least, I am assuming that's what you meant to say by your antic
alliteration.

No, I'm sorry, you're wrong. "Spelt" is a type of grain (like wheat, rice, etc.). "Spelled" is a word.

I try to be nice. You like to be mean. But, in the end... I will catch and squash you, like the tiny insect you are, on EVERY MISTAKE YOU MAKE!

So, who's the smarter one, hmm?

Oh, and you want another nugget of wisdom? Type in "Vitamin B17", "Wheatgrass", or "Apricot kernel" into Google and learn that there is a natural *CURE* to many types of cancer that the FDA and outside world don't want you to know about, because they can't make any money from it.

Off-topic, I know, but... just like I helping people wake up (just as I did a few days ago) to the knowledge that the "governed world" is NOT our friend, but the plants in it, ARE!

Luposian

# 3717. Re: 130XE Keyboard prob

The ribbon from the keyboard plugs into a connector on the mother board and the contacts are numbered. The problem is either a bad contact or a crack in the trace going to #14. We need a schematic for the numbering layout unless there is a mark on the MB near the connector indicating #1. Normally the contacts are numbered from one corner down one side, U-turn around the corner and back up the other side just like chips and sockets.

Gyruss is a variation, a big variation, on Bach.

No. 1 for me without a doubt is the arcade Outrun music. Still enjoy
listening to that immensely today.

Also LED Storm, and most of Rob Hubbard's masterpieces (especially the Delta
in-game music).

They don't make 'em like that any more. :/

Dot Matrix printer.

And they did at that time.

Remember, the bundle was, CPU, storage system, printer, and WP software
suitable for letters, and school papers.

You guessed wrong.

How many people will buy a computer when they hear that the machine destroys it's storage? The major weakness with the ADAM in the fall of 1983 was that the high speed tape system wasn't debugged yet. It would sometimes turn both spindles in opposite directions (not good!) or lose blocks, so that the 256K tapes could quickly be 128K tapes, etc. All the bugs were worked out, disk drives were released as well as CP/M (the ADAM used a Z-80 at 3.56 mhz) software other than games was being release, but the machine had earned a bad rep, because management wouldn't listen to the engineers.

Well, Richard, for corresponence and school papers, a daisywheel is far
superior to a DMP, esp. one as poor as Commodore offered with the C-64.

I'm not saying the C-64 was junk, not at all. Coleco simply had a great
idea, at a great price, and failed to impliment it properly. They were a
toy company trying to make it in the low cost home computer market
(where even IBM failed - remember Junior?)

Consumer's Reports went with the Atari over CoCo, C-64, and ADAM, for
two reasons: the Atari printer (1027 I think) and AtariWriter. But they
did the comparision because of the ADAM. It was a new idea in that market.

Sheesh. Lighten up a little.

For coin-operated video games, my favorite music is the beginning audio from
Galaga.

For PC-oriented video games, the opening theme song from Leisure Suit Larry
1.

Perhaps you're right.

However, I've seen TI 9900 and 99/4a sites that said the 99/4a had an 8
bit memory bus.

Further I suggest you read the 990 Computer Family Systems Handbook By
Texas Instruments published in 1975.

The manual covers the models of the 990 family, the 990/10, using a TTL
implimentation, which could have through "memory mapping" up to 1
million 16 bits words; the 990/4 which used the 9900 chip.

"990 instructions build a 16-bit address word which may be views as
describing a 64K X 8 CPU address space. The LSB is used inside the CPU
to address bytes...." pg 2-8

"16 bit machines with bit, byte, and word capabilites" pg 2-1

This seems to suggest that 8 bit operations and addressing is possible.

You misread Peter's post; he was replying to Max Volume (in a post in
which MV happened to be replying to you), not to you or to the post of
yours MV was quoting...

And I agree with Peter, MV is an obvious troll...

I'm not Richard. Besides, we aren't talking print quality here, it's
about overall performance and usability. The Coleco piece of shit was
loud as hell, and if I remember correctly it had a problem with
character alignment. I don't know about you, but I'd rather have 60dpi
dot-matrix output that's in nice straight lines than impact-printed
output that looks like it was printed by Gutenberg.

I can't believe I have to explain to someone why the ADAM was useless.
Only on Usenet. :/

If you don't have a Windows box, but do have access to a Linux or Unix system (e.g., you dial in to a Unix account using a term program on your Atari :^) ), you can use either ImageMagick or NetPBM to convert files before transferring them to your Atari.

For example:

djpeg ORIG.jpg | ppmtopgm | pnmscale -xysize 300 200 | cjpeg > GREY.jpg

My favorite game score is probably from "Street Beat". Those of you who haven't played this game might want to do so, it's awesome.. you wander around the streets collecting tapes for your "Ghettoblaster" and try to get people to dance to them by throwing notes at them, while avoiding the cops and serial killers. Excellent SID tunes. Commando was good, as was Spy vs. Spy, Ghosts and Goblins, Stealth, Burger Time. . lotsa stuff.

I always liked the 'round-up' music from Galaga (when it shows how well
you did in a challenging stage). It's pretty much the same song, but it's
slower, echoey, and just kind of ghostly sounding. ;)

Not sure. . I've only ever played the C64 version, I don't know if there is another version. If there is I'd be interested, but the game kinda centered around the SID music. Each tape you collected played a different tune.

>No, I guess you're not so bad. BTW, what's an ADAM? ;-)

ADAM was the name Coleco gave to their computer. Todays manufacturers give
their computers names too. For example, the HP Pavilion. And there is
someone in one of these newsgroups that has names I can't repeat in public
for Compaq computers. ;-)

Exegete wrote ...

>Well, Richard, for corresponence and school papers, a daisywheel is far
>superior to a DMP, esp. one as poor as Commodore offered with the C-64.

Well, I'll have to admit that the print quality of the bottom of the line Commodore printers left a lot to be desired. Commodore did sell a daisywheel printer, but it was priced a bit on the high side. There were third party daisywheels for Commodore at reasonable prices. The brand name "Blue Chip" seems to come to mind.

And Star sold an excellent NLQ dot matrix with a builtin Commodore interface

>I'm not saying the C-64 was junk, not at all. Coleco simply had a great
>idea, at a great price, and failed to impliment it properly. They were a
>toy company trying to make it in the low cost home computer market
>(where even IBM failed - remember Junior?)

As I remember, the only advantage the PC Junior had over lower priced systems was the IBM name on a decal. Most people wanting a home computer went with the lower cost of Atari, Commodore, and on the other side of the pond, Sinclair.

Meanwhile, those wanting a small business computer bypassed the Junior in favor of the XT Clones selling at about the same price as the Junior. Some small business owners, of course, opted for the Apple II.

The Coleco Adam did make it to market. But, most potential buyers connected the name Coleco with the word toy. They stayed away from it in droves! The connection may have been what killed the Adam.

Just as people chose The Atari 2600 over Intellivision(sp?). The name connection. Mattel was a _toy_ company, not an _electronics_ company.

>Consumer's Reports went with the Atari over CoCo, C-64, and ADAM, for
>two reasons: the Atari printer (1027 I think) and AtariWriter. But they
>did the comparision because of the ADAM. It was a new idea in that market.

A manufacturer offering a package was a new idea. Retailers were already offering complete "home computer" packages featuring Atari and Commodore computers. And I'm sure English retailers offered Sinclair package deals.

Again, poor design (those stupid disc controllers), plus a lack of
arcade titles, which was almost the whole point of owning a video game
console -- so you could play the arcade hits at home.

IIRC, JTS wanted to become a public company without jumping through all hoops. The Tramiels just wanted to screw with people and make a buck. By buying Atari, JTS then became a publicly traded company.

Yes, the Adam used a daisy-wheel printer. For cranking out documents in the
era before laser and inkjet printers (afforable ones, anyway), a daisy-wheel
printer would've delivered far superior print quality. (Not everybody
wasted time with games and demos...some of us did real work with our
computers.) Dot-matrix printers generally did only a usable job with text,
but had the advantage of being able to do graphics as well as text.

BTW, dot-matrix printers are also impact printers. (If you want to be
pedantic, laser and inkket printers use smaller dots in a matrix to form
images and text, but "dot-matrix printer" typically refers to a heavy, noisy
beast that uses 9 or 24 small pins poking at a ribbon to put ink on paper.)

IIRC, the Adam also had some sort of high-speed tape drive, not merely a
cassette recorder with nonstandard connectors (what Commodore did to lock
you into paying extra for theirs). A disk drive would've been better, but
it may have been a bit much to expect one in a computer system that cost
less than $1000. That's one reason why Apple II and IBM PC systems often
started well over $1000 (over $2000 wasn't uncommon, and that's what you
continued to pay for a decent computer system through the mid-to-late-'90s).
They were proof that you get what you pay for.

hehe...he knows it does not have a poor DMP yet he doesn't know what a
DMP is?

>Dot Matrix printer.
>
>And they did at that time.

Agreed, I don't know of any DMP's that were worth a shit at that time.
I remember saving for an eternity and buying a Radio Shack DMP-110 for
my Model III. Special two strike hammer system with multi font....NLQ
my ass, the print out was downright horrible. I threw away $400 on
that thing. Daisy wheel was the only way to go at that time.

Towards the late 80's manufacturers got it right. I purchased a Star
NX1000 II for around $200 mail order. Fast, beautiful letter quality
print and the ribbons last forever. That printer is 2' away from me
and hooked up this computer. Still works as good as the day it
arrived nearly 15 years ago. For about a year I replaced it with a
new Xerox ink jet. Replacement cartridges cost more than the printer
(which included the ink) and the print head lasted about 1 year. Imo
ink jets are the biggest consumer scam. Practically give the printer
away but rape the customer when it comes time to replace the ink,

which lasts about a week.

How many consumers back then actually knew it destroyed its data
packs? I was very much into computers and this thread is the first
I've heard of the ADAM having a flaky storage system. There was no
internet and the average mom and dad buying their kids a new computer
didn't research a dozen different magazines. Did the ADAM have a high
rate of returns due to this problem?

I used to drool over the ADAMS tape drive system. Compared to my
Model III's 1500 baud cassette, the ADAM was light years ahead. Plus
it was upgradable to a dual drive system. The one kid I knew who had
one never had a problem with the tape drive.

Atari and Commodore were dedicated computers that already owned the
market. The ADAM was a great idea released at the wrong time. Also
there was all the hype of the Colecovision's expansion slot accepting
a real computer system. With all that hype and the confusing sales

flyers I doubt most consumers even knew there was a stand alone system and thought they automatically had to own a CV in order to use the ADAM. I'm sure the thought of having to purchase a CV for an additional $200 was a big turn off for many people.

Also look at other game systems that had the computer hype of the time attached to them.
The impressive looking O2 with the full membrane keyboard which was nothing but an inferior game system.
All the crap surrounding the Intellivisions computer add on which resulted in the joke known as the ECS.

After that how could anyone take a game consoles "computer add on" seriously?

George

Richard - Dick - Dickhead

You're so dense you didn't even get the allusion to your own statement.

Besides, we aren't talking print quality here, it's
> about overall performance and usability.

You're changing the subject. Print quality was very much the issue.
Instead our arguing from the air, go and read the Consumer's Report
article - 1984. Then you won't be so ignorant about the issue under
discussion.

The Coleco piece of shit was
> loud as hell, and if I remember correctly it had a problem with
> character alignment.

Not on mine. And it was a fine little machine.

I don't know about you, but I'd rather have 60dpi
> dot-matrix output that's in nice straight lines than impact-printed
> output that looks like it was printed by Gutenberg.

Well, some of my class mates in grad school, using C-64's with their
printers were told to no longer turn their papers in until they had a
type that wasn't giving the prof's eye strain. My Coleco's print was
just fine thank you.

>
> I can't believe I have to explain to someone why the ADAM was useless.
> Only on Usenet. :/

You'd have to explain it to me. I used it for two years in grad school.
It did the job for me, nicely. Of all the "home computers" only the
Atari was any better for the purpose.

Roy

The ADAM's design was great. Once again, the weakness was letting a
machine hit the market before it had been debugged. By the time the bugs
were worked out, well, Edsels never sold well either.

Dead on the money Scott. An Apple was a far superior machine for the purposes that CR did their comparison, but the Apple and the IBM cost far more than the c. $600 a Coleco was priced at.

Some haven't gotten the point, which you did. An inexpensive home computer that would do light weight word processing, and that was completely bundled for c. $600. CR put together systems based on the CoCo 2, Atari 600XL (later in the year an article covered the 800XL), the C-64, and the Coleco. CR did the comparison because of Coleco's marketing - one box, one price, one complete system. How did the competition stack up. The C-64 was a fine machine, but because of it's poor dmp and software, it came in behind the ADAM and the Atari. That didn't mean the C-64 was junk, or couldn't do other fine things. Nor did it mean that you couldn't get better printers for the C-64. It only meant that you couldn't put together a Commodore badged system for that price that did the job of word processing as nicely as the Atari or the Coleco.

Sheesh, people, if you'd read the posts, like Scott did, you'd not argue about things that are on the table.

Some were only 7 pin printers. That may have been what the Commodore in
the article was equipped with.

Yes! Byte covered the problem. My memory of the CR article mentioned
that the problem had been worked out. I never experienced any of the
problems. Coleco stockholders sued management over the issue.

>

I loved it. It was slow - compared to an IBM disk drive. From what I've
seen of Commodore disk drives, well.... I never had ANY problem with
mine. But all the ADAM's I've ever seen had the warning not to leave the
tapes on top of a color TV, or it would be erased. Perhaps, or perhaps
that was a "cover" for tapes that did go bad.

There were two "versions" one expanded the CV into and ADAM (I have one
of those) and the stand alone version (that's what I owned in the 80's,
and I now (again) have one of those.

I've wondered it that's why neither Sony nor Nintendo ever released
add-ons that would make their game systems into full computers.

The 9900 series was a 16 bit chip but the rest of the MB was 8 bit. 9900 had local 16 bit SRAM because of the way the 9900 was designed around the philosophy in the TI Minicomputer processors. It had nothing to do with bus but the SRAM needed to be 16 bit because the standard DRAMs where 8 bit RAM and be too slow. TI wanted to speed things up a bit (despite how slow its BASIC was due to the double interpreting). The SRAM was a 16 bit memory which acted like a quasi cache. The 9900 was based around the 990 controller board. The local SRAM was not multiplexed but the rest of the RAM is multiplexed. They simply wanted to speed up execution at machine level. What TI should have done is provided GPL as the programming language or made BASIC interpret directly to Assembly. Thus eliminating that double-interpreting and the machine would have been easily a bit faster than even the c64. If they did that, things may have been a bit different. Technically TI had a fairly decent computer despite most of the computer was 8 bit but CPU instruction and the local SRAM circuit was decent. TI assembly language program execute a bit faster than 6502 programs. So TI would have had a decent design. They were hoping they can make the rest of the system 16 bit but that was not the case.

Well, the 1526 wan't that bad at all. I still have that printer and it
still works. It was just simply a bit slow compared to modern printers.

It only depends on which model DMP you chose. CBM offered various models
of DMPs at the time. The 1526 was one of them and did a fairly decent
job.

For me, the best video game music of all time is the title theme to Skate or Die 2 - The Search for Double Trouble. Those heavy rock riffs, sounding like its coming from a psuedo-amp, is great. And then the lyrics, which go like this:

"Skate - or - Die!"
"Skate - or - Die, Die! Die! Die! Die! Die!"
"Skate - or - Die!"
"Skate, Skate - Skate, Skate - or - Die, Ddddddddd Die!"

Very inventive, don't you think? Its much better than the game that comes with it. Truly, Skate or Die 2 has aged very poorly.

Actually, it sounds far too strange and derivative to be my favorite. So I would probably put my favorite classic video game tune as the soundtrack for Ultima IV - Quest of the Avatar, on the Apple II with a two chip Mockingboard. Like Gyruss, it uses multiple AY-8910s (two as opposed to five.) This also gives it stereo sounds, with 3 voices per speaker. The themes composed for each part of the game as perfect. The dungeon music is a descent into darkness, the castle music imposing, the town/main theme music a thoughtful evoking of virtue, the shrine music meditative, the wandering music is one of high adventure, the combat them rousing, and even the smaller pieces, the shopping and Lord British themes, are pleasantly appropriate.

If you want a single music piece, then I would pick "Stones (by Iolo & Gweno)" from Ultima V - Warriors of Destiny, which sounds best using two Mockingboards with 4 AY-8910s, but is particularly adaptable to Midi. Dramatic, haunting, well-paced, appropriate length, it is worthy of inclusion into a classical library.

Leaving *any* kind of magnetic storage on top of a television is never
a good thing. I'm not sure why Coleco specified a colour television
either. All TVs, to my knowledge, play around with magnetic fields,
and can damage magnetic media.

Aside from loving the Bubble Bobble in-game music, and of course Galaga, most of my fave music is from Amiga games. The Zeewolf theme was a classic, and Project-X had good music too. I seem to remember liking the Disposable Hero music, though can't remember it right now. And of course the Pot Black-style piano janglings on Team 17's Arcade ["Pool"|"Snooker"]. Other than that, my favourite 'in-game' musics were as follows:

On the Dragon 32, load a text adventure with "CLOAD:MOTORON:RUN" then stick a tape in whilst playing. So Black Sanctum would be played to, of course, Black Sabbath, El Diablero would be Alberto Y Lost Trios Paranoias, Franklin's Tomb[1] would be Frankie Goes to Hollywood, and so forth.

Bored of the in-game music on your favourite Amiga game[2]? Well, if it runs in Workbench (i.e. is OS-friendly), then chances are a quick scoot through with a hex editor will sooner or later throw up a mod file embedded into the code (if you're very lucky, it'll be in its own file). You know what to do from here...

[1]Franklin's Tomb loaded with a brief - and probably in the octave equivalent to PLAY "O2" on the Speccy - rendition of Pink Panther. Salamander did this a lot, one of their Star Trek style games had a brief snatch of the Thunderbirds theme.
[2]One of my all-time favourite games is Zool, which had some fantastic beats. The only problem was you chose which track to play at the beginning of the game and you couldn't change it until you had to start again.

There was a simple Tetris-style game I played years ago on the Atari
that included renditions of songs by Jean Michel Jarre
(e.g., Oxygene, Popcorn, etc.)

Anyone remember what it's called?

Thx!

-bill!

yea. I do :) Will send ya my email off line

I'm not the orignal designer of the super products, but I have upgraded the
1050 supermax rom to accept the format command from Spartados. took a bit
too because the guy didn't have the orignal source. also had to pull apart
the usd to see what numbers where accepted in the format command etc.
discovered that usd can format any number of tracks you tell it to.

<besserwisser>
Popcorn is not by Jarre (although he might've performed it as a cover),
it is by Hot Butter from the early 70'ties. :-)
</besserwisser>

But no, I don't know the game you're looking for.

It's nice to see that the people that seem to hate you, are so ineffective at doing do. If you can pick a few pearls (sales) out of an otherwise stinky trashcan of garbage (flames and hate replies from anonymous cowards and other "believers of the lies"), why not endure the stench to do so, I figure. :-)

BTW, assuming you've been reading any of my posts, if Atari, Inc. decided to start selling computers again, would you be interested in selling them? In other words, are you just trying to get rid of current inventory and get out of the Atari business or would you continue to "sell Atari" if more, new stuff arrived? Just curious.

Apples and Oranges. The early 80's were about convincing parents that brand X game console had educational properties and could later on be converted into an inexpensive full fledged computer. These were huge selling points on TV commercials, magazines, Sunday sales flyers and even product boxes. Mattel was actually sued over it resulting in the ECS.

For some reason I don't think we'll ever see that unknown PS2 dev kit advertised on TV or be able to purchase it at Best Buy, Walmart or Target.

Education and game consoles just don't go together and probably never will. Even the browsing abilities of the DC was nothing more than a novelty and everything was included except a $15 keyboard.
At least in the early 80's the hype had a chance to work since computers were rare items that few people owned and there was no standard OS on the market. Today it would be a huge joke since PC's are just as common as color TV's.

George

Negative attention. Positive attention can be attained by posting a link to
your ads. That keeps everybody happy, it minimizes the amount of spam in
this group to those who are not interested and yet makes it easy for people
to find you should they need something. Which part of this don't you
understand?

All you are doing is dividing your potential customer base. Not a very smart
move from a "businessperson" attempting to make some money from a niche
market.

Regards,

Clockmeister.

It's not so much what I don't understand about Ben... it's what I don't understand about why there are people using SLANDER to drive him off. They claim Ben is gay... akin to some huge, 800lb. male gorilla-humping homosexual, when it is more than 100% likely that they are simply clueless about him personally and doing ANYTHING they can to drive him off, because they are tired of his repeated advertizing posts.

I think the device is known as a "kill file" (not sure how you use one or what they are exactly), but the offended people should just use them, so the messages he posts simply don't appear on their end.

Think of this (or any other newsgroup) as a TV. You advertise X number of times on TV to try and get your product into the eyes and minds of potential customers. Advertising here is free, so in encourages him to post more often.

Can you image what Atari's business success rate might have been like if they had been able to advertise as cheaply as they could today, across the Internet?

Do we rant and rave everytime we see a Procter & Gamble commerical selling Crest or whatever and say "Yeah, those guys at P&G are all a bunch of 800lb HOMOSEXUAL FAGGOTS, THAT HUMP GORILLAS ALL DAY LONG!" No. We either IGNORE the commerical, tune the volumn down./off, change channels, or, at the very least, walk out of the room!

Personally, I have little to no interest in what Brovao (wha... huh? What typo monster typed THAT? I mean Bravo) Sierra is pitching to sell. Why? I'm out of the Atari arena. Atari doesn't sell hardware anymore, so I'm not buying anything Atari anymore. The only reason I want an Atari 1040ST case is for my own strange ideas of possibly creating a pseudo-prototype of some whacky Atari PC I want to see happen.. Nothing more. Nothing less.

But I kinda like seeing someone... ANYONE... selling (or trying to sell) Atari stuff. It shows that there is still someone in the vast desert known as Ataridom, trying to keep the spirit alive... or at least get rid of what they've got so they can close their doors forever! :-)

> All you are doing is dividing your potential customer base. Not a very smart
> move from a "businessperson" attempting to make some money from a niche
> market.

At least he has product to sell. Look at me... I get attacked because I'm pitching nothing but a DREAM! An IDEA! I've got Steve Sweet going after me like I'm some sheep he wants to rope and make happy! At least Ben's trying to sell something tangible!

'Tis easy enough to ignore or avoid him, if ye like. Why waste effort and energy attacking him?

Luposian

Actually, the Gyruss version is based on the arrangement by
rock-classical-jazz-fusion group Sky, who had a big hit with "Toccata" (off
their album "Sky 2") in, I guess, 1981.

Highly recommended stuff!

I remember when csa8 had multiple posts of people
running auctions. These posts bothered me. Then
Ebay became a major internet company and all the
auction posts in usenet groups went there.
Now we're getting, in my opinion, excessive cross-posts.
Some threads are common to our 8-bit machines, a lot
are about Ben Smith.
Just a reminder, before you 'reply group', check to
see the cross-posts and be sure you really want to
post to multiple groups. It isn't hard to edit the
newsgroup list.

The reason why people like myself, and Steve S dont like your shit is I
guess is because weve had this "I had a dream" crap for like nearly the past
10 years. All you do is succeed in opening old wounds in people who have
seen thier beloved Atari platform flatline on the operating table, and
everybody has come along and stripped out the organs and just raped it of
what little was left, and then f**ked off to look for another target.
Infrogrammes is just the next in a long line...

Smeg.

# 3785. New eBay auction: Atari 8-bit Monitor Port->SCART and RCA Deluxe version

Newsgroup: comp.sys.atari.8bit
Date: 2003-06-29 22:13:08 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1056924938.19596.0@echo.uk.clara.net>
Source record: 20648

Hello All,

I have just started a new eBay auction for an Atari 800/XL/XE Monitor Port to SCART and RCA Phono cable. This new deluxe version will connect to both SCART and RCA Phono, so it will work in almost any country, except France/Russia who use SECAM (different type of Monitor Port). This deluxe version is made from high spec translucent double insulated cable, with gold plated plugs.

I also still have some items of software for auction, which are due to end soon. This includes the Atari Unusual DOS Pack, which includes Atari DOS 1,3,4, and XE.

The link is below (this will split on to two lines, so please copy both lines into your browser):

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=deangarraghty

>name in arcades again or sells those assets to someone else who does.)

Actually, that's not true. The Atari 3-in-1 from last year (Centipede, Millipede, Missile Command) was an officialy released Atari coin-op released through cooperation between Midway and Infogrames, and manufactured through Team Play, Inc. The original deal was for a coordinated US (Midway, Team Play) and European release (through Infogrames' coin-op subsidiary). However it was released here before the deal went through - consequently the Atari name (which Ingrames fully ownes) didn't go directly on the coin-op. Instead Team Play put the Infogrames name to cover all bases. On a side note - the Atari copyright in the roms were replaced with a Midway copyright when the roms were delivered. Hence they were to change them back to an Atari copyright, but instead did Infogrames because of the same previously mentioned problem.

Have you ever owned a one piece computer system? Those systems were
designed to work that way so there is no reason people shouldn't have
bought one. Just about every high end serious business computer was
all one piece with either 5&#65533;" or 8" floppy drives back in the early
80's. The floppy drives on my TRS-80 Model III still work fine till
this day and have never had a problem with losing data. My guess is
the Apple systems had a shielded drive tower just as my Model III
does.

Toss a disc or cassette right over any monitor (where there is no
shielding) and there's going to be problems, especially at start up
when the degausing coil is activated for a few seconds.

>machine hit the market before it had been debugged. By the time the bugs
>were worked out, well, Edsels never sold well either.

But, as I remember the Edsel didn't have any bugs. It was just a Ford with different sheetmetal, dashboard, etc. Edsel had the same engines, chassis, electrical system, etc. as Ford did. People just didn't like it.

I still think the connection to a toy company that the ADAM had was more responsible for its demise than any bugs.

Nearly all color television sets have an automatic degaussing circuit, the purpose of which, is to demagnetize the picture tube (CRT). If the picture tube becomes magnetized, it will result in convergence problems. Black and white TV's don't have a degausser as there is no need to worry about convergence with a single electron gun.

BTW, most color monitors have a degausser also.

This is a public newsgroup. Not some private clique! As long as he follows newsgroup protocol and any rules therein, he has just as much right to be here as any of us. Do as I do (though I'm sure you'll avoid that as much as possible, for personal reasons)... ignore what you don't need or want and read what you do, if present.

I "read" very few posts here. Mostly ones relating to threads I've posted in and expect replies in. I know how to randomly search and find what material I'm looking for. I don't "batch read" (nor am I forced to) every single message and reply. That's stupid!

You, of all Atari newsgroup denizens, should know that, if a low-life, scum-sucking, pork bladder, lice-infested nobody like me (dang... I'm soooo

good at self-depreciative comments! I should demand money for doing this!)
can do it, surely you can, too.

Or are you admitting that you're lower than I am on the evolutionary scale?
:-)

Nearly all those machines had monochrome monitors, no shadowmask so
degaussing is not needed. But 'one-piece' machines still needed some form
of shielding to protect the floppy-drives from the strong magnetic fields
of the deflection coils on the CRT.

The Apple Imagewriter was fairly decent, as far as 9-pin printers went. It
didn't have a built-in NLQ mode like many others of the time, but software
for the Apple II (and, I suspect, the standard Imagewriter driver for the
Macintosh) delivered print quality as good or better by basically running
the printer in graphics mode at 144x144 or 160x144 dpi. Text output on an
Imagewriter from AppleWorks 3.0 with SuperFonts was pretty good, and you
could use any of the hundreds of bitmapped fonts that were available for the
IIGS (which were, in turn, largely borrowed from the Mac).

The first inkjets weren't as obvious a ripoff. A $30 cartridge for a $500
printer isn't so bad. A $30 cartridge for a $50 printer is more
questionable.

I've had thoughts of hauling one of my dot-matrix printers in to work, for
sh*ts and grins if for nothing else. Continuous feeding would be kinda nice
for browsing source-code printouts...

Color TVs (and monitors) have degaussing coils built in around the edge of
the screen, to get rid of the magnetization that can build up on the shadow
mask. (That's the source of the buzzing/humming sound when you switch on
your monitor.) The magnetic field put out by the coil is a Bad Thing for
your data. Black-and-white TVs, green-screen monitors, and other monochrome
displays don't have degaussing coils because the tubes have no shadow mask
to demagnetize. (They still have electromagnetic deflection coils at the
back of the tube, but they're not located just under the top front edge of
the monitor case.)

Well, PS2 incorporated USB ports and thus - you can hook up any USB
keyboard & Mouse so Sony doesn't have to make special keyboards. Add a
2.5" Laptop style HD to your PS2 (I believe is also the same style HD as
used on the Amiga 1200) and an OS such as Linux and it is a full computer.

Just add the HD, OS & Keyboard/Mouse and a USB Zip Drive or CD-RW and Bingo
a computer.

Not really because PS2 had USB ports so you can use USB keyboards & Mouse
right away and a Zip Drive and add an HD and have a Linux OS and use it
for education. The difference may be an HD in contrast to older Atari
2600 but doesn't make it really any different. Simply, Linux is often too
big with all the software available to fit on a floppy disk. What do you
expect in 20 years.

So, I don't think it is any different.

Only some laptops with LED or LCD screens, where this problem with
magnetic fields doesn't exist. I always thought 1-piece computers
systems with CRT displays either were too bulky or had a screen
too small.

> Those systems were
> designed to work that way so there is no reason people shouldn't have

...I don't think so. CP/M machines were the most common micros used
by businesses back, and they usually had a separate terminal. And
minis and mainframes (which were the most serious computers back
then) _definitely_ had separate terminals !!!!

> The floppy drives on my TRS-80 Model III still work fine till

No thanks... :-( ....but here you provide an explanation why these
integrated CRT terminals didn't pose a problem to magnetic storage:
back then, degaussing coils were rare.

Put a quarter inch metal plate inbetween and you can reflect any of the
magnetics. It was as simple as that. If you reflect the magnetics away
from the disk drive mechanism. You will be just fine. Just keep the disk
away from the back of the tube and away from speakers. The field is about
4". A metal plate can take care of that.

Yep, shadowmask. Hmmm.... magnetizable paint. Well, Lord Ronin knows all
about this stuff as he worked on this TV crap. Just put a 1/4" metal
shielding plate and you won't have to worry about it. Add that with
enclosed Drive Mechanisms and you will be just fine.

Ok, so here comes my best choice of non-classic videogames:
Deus Ex (done by MCA, the same as in HVSC directory /VARIOUS/M-R/MCA)
Diablo (such a nice and relaxing guitar tune in the town, never gets boring
even on the 24th loop)

And while we're at it, the latest Metallica needs a few listens. Really
powerful album after the last 3 really softwashed ones. :-)

Full blown laptop computers with LCD screens didn't exist back in the
late 70's/early 80's. If you were around and able to use a computer
back then you had no choice. Towards '83 there was the Tandy 100 but
that was more or less a fancy rolladex.

We're not talking about terminals, mini's and mainframes.

I can give you a mile long list of popular systems (most CPM
compatible) that were all in one, including every TRS-80 (model II,
III, 4, 4P, 12, 16), Kaypro's, Osbornes, macs, ect.

What business systems from 1982 and earlier do you recall that used a
separate CPU, keyboard and monitor? Something that you would walk
into a persons office and see sitting on a desk?

It's not just the degausing coil, a b&w CRT will easily scramble data
on a cassette or floppy. The degausing coil was aimed at the ADAM
warning lablel post about color TV's. I also don't know of any
terminals from back then that used any type of storage. All I picture
is the little amber or green screen monitor with a separate keyboard
or the one piece mostly hollow Service Merchandise "Silent Sam"
terminals.

## 3813. 2nd try: Let the Minigames begin!

Apparently my first attempt never made it past the local news server, so I call do-over:

Howdy all,

The 2003 Minigame contest is now officially open:

http://www.ffd2.com/minigame/

Last year's contest was a huge success, with 62 entries. This year's contest has two categories, 1k and 4k. There's also a BBS for discussions and getting help with games, and several other changes and nifty things.

Last year there were no Atari entries, and there's NEVER been an Apple ][ or CoCo entry. What's up with that? We need you too!

Come on, your computer isn't THAT inferior to the Commodore 64

(I'm JUST KIDDINGsort of -- no, really! Hah hah, no need to email!)

Anyways, it's totally fun, so hop on over to the webpage and check it all out, spread the word around, and get working on those games!

-Steve

(And sorry about the delay :)

(And I really would love to play some Apple games again!)

(And that goes for the rest of you!)

jarre did have something to do with popcorn.

all i know is the b-side to the 7" of popcorn is called "blackbird" which is
a jean michel jarre song (from les grange brulees)

therfore hot buter = jean michel jarre(?)

I don't think Tim underestands what I'm talking about auction posts in csa8, oh, two or three years ago. These weren't notices of auctions being held someplace else, like ebay or a web site, these were like 10 to 20 auction posts in csa8. They haven't occured here for years. There would be maybe 40 or 50 auction posts, making it very inconvenient to read non-auction posts. Our European, some, participants were especially bothered by the auctions because they would take maybe 2 or 3 minutes to load the group to read it every day, much longer if 2 or 3 days. Most European participants pay per minute for internet connections.

Besides, I said 'in my opinion', and I don't think you know what I'm was talking about.

Microsoft proved that it was technically very easy to build a console: put the latest PC hardware in a fat green box, build a proprietary SDK and you've got an Xbox! The rest is all about the cash and marketing.

It takes skills and inspiration to design beautiful and compact systems like the Sega Dreamcast or the Atari 800XL, but the success of consoles will always depend on the quality of the software for them, which is Infogrames's specialty.

I'd like to point out that Bruno Bonnell and Infogrames have been around for a long time and have a long list of quality classic games developped for french and british platforms like the Thomson, Sinclair, Oric and Amstrad (and later the Atari ST). Needless to say the Atari name is in better hands with Infogrammes than with Hasbro or even the Tramiels and that if they keep afloat with their finances, they might as well come up with some decent Atari hardware in the next few years.

<offtopic>

All Music Guide (www.allmusic.com) tells the story of Popcorn: it was written in 1969 by Gershon Kingsley, but made popular by Hot Butter, a.k.a. keyboard virtuoso Stan Free and some support musicians (may have included Kingsley himself). Unfortunately, AMG has no record of a Blackbird song.

Jarre on the other hand is born in 1948, so theoretically he is old enough to have heard Popcorn when it was released, whatever difference it does.

There are roughly 700 songs in AMG's database where "Blackbird" is included in the title, so if your assumption is correct, I would also assume Jarre is a pseudonym for Paul McCartney, John Lennon, Crosby/Stills/Nash & Young, Jos&#65533; Feliciano, Modern Talking and Nina Simone, to mention a few. :-)

Hmm, that might be something. Jos&#65533; Feliciano sings Jarre...

</offtopic>

Nah, I should save my efforts in programming for the MiniGame compo instead (free plug).

The folks at atariarchives.org are thrilled to announce that the full text of Atari Roots is now available on the Web.

Published in 1984, Atari Roots is perhaps the best guide to Atari 8-bit assembly language ever written. The site includes the full text of the book, plus downloadable software and source code, at:
http://www.atariarchives.org/roots/

This is the 16th classic computing book to be made available at atariarchives.org.

You were talking about "systems" -- they include mini's and mainframes,
which back then was dominant among serious computer users, who often
regarded micros as just toys....

> I can give you a mile long list of popular systems (most CPM
> compatible) that were all in one, including every TRS-80 (model II,
> III, 4, 4P, 12, 16), Kaypro's, Osbornes, macs, ect.

>
> What business systems from 1982

Was Trash-80 really a _business_ system?

> and earlier do you recall that used a separate CPU, keyboard and
> monitor? Something that you would walk into a persons office and
> see sitting on a desk?

The Altair, IMSAI 8080 and most S-100 computers, including brands
advertised specifically as business computers, such as the North Star
Horizon. And, of course, the Apple II which got used as a business
system too..... and the Apple ///....

Later the VIC-20, Commodore-64, Sinclair ZX-80, ZX-81 and Spectru,
the Jupiter Ace and many more appeared, which had separate displays.
But they were not business systems.

In 1985 I started working at a computer consultat company who ran
their internal business system on a MP/M computer to which 4 terminals
were connected.

(Plugs Speccy music page)

http://www.aldridge98.fsnet.co.uk/specmusic.html

As far as arcade games go, Galaga has very cool music. I put it on my mobile phone. Cool? Ironically geeky? Sad? Who knows? (The answer's sad - but I don't care).

I always liked the music from Super Mario World on the SNES - the only computer game I know to feature what sounds like a ukelele!

'Tail's theme' from Sonic Adventure 1 is a very cheesy song, but I like it nonetheless.

Also, the song 'Change' from Grand Theft Auto 3. Sometimes, when I'm playing, I'll park the car and just listen to that song when it comes on, waiting until it ends before continuing.

I guess system can mean a bunch of different things...I consider my
Emachine that I'm typing this message on to be a system. An no wise
cracks about the E...out of the dozens of computers I've owned it's
been the most reliable : )

>> I can give you a mile long list of popular systems (most CPM

>
>Was Trash-80 really a _business_ system?

All except the CoCo's. The model I was more of a ground breaking
hobbiest system. The III's popped up everywhere from homes, schools
and businesses (I still laugh everytime I watch Airport and see the
III's at the terminal). The 2, 12, 16 were very expensive heavy duty
office type systems not designed for home use. They used the big ol'
8" floppies and were available early on with hard drives. I think a
few of those depending on options hit well over $10 grand.

I owned a very basic 16K cassette based model III. It was $1,000 plus
the cost of the cassette recorder. Fully loaded with dual floppies,
48K, RS232 board and Orchestra 90 sound board brought the price up
towards $3,000.00. I eventually got there but only after all the
parts were heavily discounted. I know the original price of the Drive
0 kit was $1,000.00 alone.

I'll give ya that...I'll say there's a fair share of both.

Considering when they were released I never understood why the C64 and
Atari 800's never made it as real business machines? I would say
either one was able to hold it own against the first 4.77 mhz XT's and
they cost a fraction of the price.

At the very beginning, IBM considered the PC to be a game machine for
home use.....

BTW the XT had a hard disk (10 MBytes -- tiny by today's standards but
enormous back then), which probably partly explains why the XT was so
expensive (the other reason it was so expensive was of course the
brand name "IBM". Otoh, when Apple released the Lisa, and later the
first Macs, they did the same thing: these were _not_ cheap machines!).

On Sun, 29 Jun 2003 at 15:29:19 GMT, L Levy scribbled:
->... over the past few days, large numbers of objectionable posts
->are appearing that I do not want on my computer. I cannot remove
->them because I'm not the author.

The computer world doesn't work the way you think it does, or
to put it another way, it doesn't have to work that way.

Postings on the Usenet aren't stored on your computer (or if they
are, you would do well to change your programs and/or your methods).
A few days' worth are stored by your ISP, and whatever newsreading
program you're using is merely viewing those postings. Different
ISPs use different filtering software to weed out spam and porn ads.
On your end you also have a choice of software (newsreaders, filters,
etc.), with different possibilities for how you set it, and a variety
of choices for what modes you use for selecting which postings to
read. Also, it wouldn't matter if you were the poster: for practical
purposes, once a message is publicly posted, it's out there for pos-
terity.

-> Unless someone can offer me a suggestion soon, I will unsubscribe.

Possibilities include: Change the way you read newsgroups. Be
selective. Set your newsreader to display only the new postings
posted since your last session. Then rather than read everything,
read only those threads or those individual postings that you think
might be of interest to you. Make that determination based on the
subject or the name of the poster, or a combination thereof, or
maybe some other factor or data listed on the message list. I use
different methods for reading different newsgroups, because many
hobby or special interest newsgroups have their own patterns and
personalities, and the amount and type of interest I have in each
subject is also different. Finally, set your program so that when
you exit the newsgroup, all postings (both read and unread) are
deleted. That way next time you log on you'll know all the postings
are new.

To do all this you may need to investigate more thoroughly how
your software works, as well as delve into such things as filters
and killfiles.

There's all kinds of Unix software out there. I haven't looked into this sort of thing lately, but there may well be Unix programs that handle file transfering between Unix and the Atari 8-bit transfer protocols.

As for "making the R: port act as a disk drive" (being controlled from the Unix platform?!), that sounds like it would require the Atari to be running a program allowing it to be operated remotely, or in reverse doorway mode, so to speak. Did Atari BBS programs do that? You might need to write your own software for that!

Hi,

> Can I just connect
> the serial port on the 850 to the serial port on my computer, and then
> copy files using R: as the destination?

Unfortunately, no. This is due to the way how the serial port of the
Atari works: It cannot access the disk and R: simultaneously. Thus, it
is not a simple copy operation from R: to D: to be done on the
Atari side. The other way 'round is simpler (disk to R:) since R:
provides a "short block mode" that just pushes data out. Thus, it would
at least require a simple basic program that puts R: into concurrent mode,
performs a block read on R: and stops whenever all data has been delivered.

In case you're interested, I once wrote transfer program for
serial data ("TTP, trivial transfer protocol") that works with a
compiled basic program on the atari side and a C program on the host
side. The original program is for the Amiga, porting it to a PC should
be possible.

> Can I do this for duplicating whole disks? Again, would I simply get
> a dump of disk contents, or is there some protocol like "send next
> sector"? And once I've done this, how do I turn the results into a .atr
> file?

Not "as is". It would require a simple program do to that.

> I may at some point want to use the Unix box as a disk drive for my
> Atari 800.

Yes, Matthias Reichl's AtariSIO can do that for you.

> Is there some software I can run on the unix side to make
> the R: port act as a disk drive?

No, since R: speaks a different language, and the handler has no idea
about "files".

> Or at that point am I better off with one of the SIO cable solutions?

Shrug. I personally used R: and the "TTP" program to transmit all my
atari disks to my Linux box, but then I already had a serial terminal
program and an 850 interface box. (Actually, an 850XL).

> Finally, if the disks don't read well, or my 810 drive is shot, where
> can I go to "recover" the data? Or should I just sprinkle metal filings
> onto the surface of the disk, and decode it visually? :-)

Actually, Atari disks are rather hard to break, don't worry. Too primitive technology. (-;

# 3838. Help on Atari 800XL required

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-01 17:09:45 UTC
From: Gerhard Pirker <digriz@gmx.net>
Message-ID: <bdsf8m$10jhur$1@ID-198914.news.dfncis.de>
Source record: 20501

Hello Folks!

Recently I got a very old Atari 800XL. I never had such a machine and so
it's something new for me.

Unfortunately I encountered the following problem:

After turning it on, there comes something like a merory-test on the screen.
It reads ROM, then there come 2 green bars.
Then it reads RAM and there come a lot of green and red squares.
I'd like to bypass this test somehow, but I do not succed.
It reads something like: 'Press reset or help to exit'.
If I press 'reset', the test starts from beginning, when I press 'help',
nothing happens...

Does anybody know what that means?
Does anybody know if there's something wrong?

Thanks in advance,
gerhard.

# 3839. APE in XP

Source record: 20502

Hi folks,

I've been trying to get the trial version of APE for Windows working in XP, but it doesn't seem to be talking to the Atari. When I try to boot, it receives a drive status command, but then just hangs. It works with no problems in Win98 (same SIO2PC cable), but I would really like to get this working in XP so I don't have to keep a Win98 machine around. Do you have to get the registered version for XP in order to use it on XP?

Also, I upraded my dos version of APE to the Windows XP version about a week ago, but have not heard from Steven at all, even after sending him a couple of emails. I'm using the address classics@atarimax.com, this is his current email address, correct?

Thanks,
Neal

You;ve got bad RAM. The screne coming up is the self test. It's coming up because it's detecting something wrong with your machine. The red squares are showing you that you've got bad RAM. On some (most?) models of the 800XL, the memory is in sockets. You might want to open up your machine and make sure that all of the chips, especailly the RAM, is seated in its sockets properly. The RAM is the 8 small chips all in a row down the left side of the board.

Good luck!

I am probably one of the few people on this newsgroup who has actually
met Ben. Actually I am not a reader of this newsgroup but one of his
ads was crossposted on another group and I followed over here.

I went to his home probably like 3 or 4 years ago to buy a computer
monitor and I had and still have no real interest in Atari beyond just
general interest and am not a collector. My first impression of Ben
was of a very eccentric person, maybe even a bit "slow" as in learing
impaired or however you want to put it. He lives (lived) in a small
home that was in pretty bad disrepair and was frankly pretty filthy
with Atari stuff virtually in every nook and cranny, with a small
office setup in his kitchen.

He was proffesional as far as the deal went and while the product
seemed a bit overpriced it worked fine so I have no complaints there.
The only thing I really remember was wanting to get out of there
fairly quick because of the condition of the house.

So there...a real unbiased opinion on who Ben Smith really is.

Actually it isn't. Most floppy drives are shielded anyway, plus they
add shielding between the components that are susceptible to the
magnetic fields inside the case. If you are concerned, simply remove
the cover and if the drive is not encased in itself, then it probably has
a piece of coated paper between it and the CRT.

try holding down combinations of shift and option on the atari as you power it up.

shift disables turbo-loader, and option disables basic (XL/XE's only). some software requires this.

generally, APE works well. never had issues with it on any platform, XP included.

Also, ensure you have APE configured correctly for your variant of the SIO2PC interface.

The hard drive was an option on most of the XT clones. Not sure if the IBM
was available without it or not. Back in the mid 1980's a lot of home users
bought a bare bones machine and added a hard drive later. By buying an RLL
drive controller card instead of an MFM card, you could end up with 35
megabytes of drive space for the price of a 20 megabyte drive. :-)

IMHO, the drives in a Mac have enough shielding to protect data from any degaussing that occurs at power-on time.

In the case of a monitor sitting on top of a desktop unit, the metal case of the computer provides additional shielding.

But, it is still a bad idea to sit a box of disks on top of your color monitor. Even if that monitor is attached to a C64 or other classic home computer.

Hey, first off I had no idea that there was that much discussion about
Ben in the first place on these groups. Like I said, I came here from
a message that was crossposted and saw all of the discussions about
Ben and thought to myself "hey, I know that guy". And then I saw the
thread that I replied to.

What I wrote was just what I recalled about my dealings with him. I
did not go into calling him names like a lot of other people here
have, I strictly wrote what I remember of the encounter of 4 years
ago. Would I buy something again from him if I was interested in
Atari hardware? Probably. Would I go to his house again like I did
to buy it in person like I did before? Most likely not. So therefore
what I wrote is relevant.

When I started with computers I read about all these things you shouldn't do. But I always liked to experiment. Keep disks away from magnets -- stuck one to the fridge with a big magnet for a couple of years, still worked fine. Keep disks away from monitors -- had some tight against one for several years, still worked. Don't put your disks on an Apple Graphics tablet -- that wiped the disks clean!!

If you were even telling a nanoparticle of truth, you'd know what state, city/town, and address you were at while "porking my missus" (I know EXACTLY where I live... do you?). Sadly, however, the degenerate primate testicle, you call a brain, can't even fathom anything less than a stupid, endlessly repeated insult.

How many times have you defaulted to insults concerning my family? When you can't think of something original (which is most of the time), you go right back to insulting my family. Gee, how original. You're worse than a broken record. No, in fact, your brainpan is so flat, they stick a stylus on your head and spin you in circles to play music! But, unfortunately, you're so full of ovine lust and stupid thoughts, all they hear is backwards masking of bad rap music!

You see, no matter what you say, I will *ALWAYS* have an original insult to come back with. You, on the otherhand, haven't a chance of such advanced thought processes... but you're welcome to try.

Don't worry, I'll try to catch the fortune cookie fragments, if your head explodes from the effort. See? Another ORIGINAL insult! How many does this make? I'm losing track... 20:1? 50:0? Eh, who cares... I'm winning.

Luposian

A static magnetic field may not erase a disk it is a flux that alters
(erases) the disk. Add to that the data on the disk is recorded on very
small pieces of iron, some disks had larger iron pieces and required more
energy to charge them (write/erase).

## 3862. In need of Mac/65 cart

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-02 03:24:02 UTC
From: Slor <slor@comcast.net>

The HD was an option on the original IBM PC. 10 meg was standard on
the XT and I think 20 was an option.

I did the RLL thing...it worked great with certain drives. I was able
to squeeze 32 megs out of an MFM drive that way. Sleazgates just
wouldn't fly with that trick though.

I loved the BBS's back then and how each would brag in the opening
screen about the amount of online space they had. I remember being
blown away when "Last Chance" upped his to 85 megs!

Then around '87 a crazy guy that owned a local Shakey's Pizza ran a
BBS out of that restaurant. I ended up getting a summer time job
there. I think he lost his business due to the amount of money he
invested in that Tandy. Back then with the optical worm drives his
bragging rights were around 12 gigs. Every night he called around the
country downloading new programs off of other top notch subcription
BBS's (I think he had a script that automatically downloaded all new
files). One happened to be Rusty and Eddies. Every night was like
Christmas for me...I was getting every current release game, some
before they even made it to the store shelves and business software
that I had no need for but still downloaded it anyways. All a local
phone call away. He didn't even realize what he was doing and this
went on for over a year until some jackass tipped him off.

I got to find out what happend to that guy. Eventually the business
failed and the BBS went along with it.

George

Your intentions are good but the truth should be known kind sir,
Ben does live amoung his inventory and he can be called 'special'
if you get the meaning in its full intent without being cruel.
His life IS second hand Atari equipment - PERIOD. Without his
Atari business he might lose his home and without his home, he
would easily fit amoung the 'homeless'. Who amoung us would
openly laugh at a homeless person? There, but for the grace of
God, go I.

To call him a faggot or otherwise belittle him is to show one
of the ugliest sides of human behavior. And to those who claim
'Oh, But I didn't know...' I say sure, like that would have
mattered a bit to an ankle bitting troll. Can we please kill
file the flamers NOW?!

>
> Thanks in advance,
> gerhard.

You may not be able to bypass the self test if the ram fails during
power up routines that do a cursory test of ram first. Red squares
indicate bad ram on the self test so its appearent that you need to
check inside your 800XL for hot ram chips. There are 8 of them on
the left side of the mother board, bad ram often get so hot you
can't keep your finger on them so test for this carefully! Replace
all ram chips that get very hot.

At that point you should see a blue screen that says 'READY'. This
would be your Basic prompt waiting for you to type in a Basic Program.
In order to have DOS or load games you will need a disk drive and SIO
cable hooked up. Turn on the disk drive first, insert a DOS disk or
bootable game disk in the drive and then turn on the 800XL. The disk
should then boot. If you want to bypass Basic you should hold down the
OPTION key while powering up the 800XL. Look for a message with the
title 'Welcome to Comp_Sys_Atari_8bit' for this group's FAQ - read, read
and read some more in order to come up to speed on your 800XL. Best of
luck...

More "Popcorn" information for the interested reader....
http://www.kingsleysound.com/Popcorn.html

I particularly like the "Wet-ones" wet wipe thingies commercial that
had a brief showing here in the states about 2 years ago during the
super-bowl with dancing pop-up wipe bottles to Popcorn.

Oh yeah, this is an Atari news groups...

Long live Atari!

I'm in almost the same boat as you, although I've never been able to get APE to work in XP OR 98. Atari810, however, works just fine for me in XP, and SIO2PC (the DOS program) worked fine in DOS mode on my 98 machine. I'd personally recommend using Atari810 for now, even though it's lacking many of the special features of APE.

On Tue, 01 Jul 2003 at 17:35:11 GMT, "Ian McLaughlin" scribbled:
->You;ve got bad RAM. The screne coming up is the self test. It's
->coming up because it's detecting something wrong with your machine.

It's not necessarily a RAM problem or something wrong with the computer's innards. It's also possible that it's running the self-test because the IO (daisy chain) connection is bad. That's happened to me many times over the years. I've found that on XLs and especially XEs, the IO connections are extremely fragile.

Nudging or jiggling the cable a little bit can make a big difference. It can also blow out the whole computer! Futzing with the cable to make sure the connection is solid is something that should be done ONLY with the entire computer system turned OFF! It's best to cover over the daisy-chain cable where it plugs into the computer to try to make sure the cable connection is never disturbed!

I've also found that if the daisy-chain cables connected to other hardware items are disturbed, that can also cause the computer to go into self-test mode.

Another question is whether the original poster has any other hardware hooked up to his computer? If there's no disk drive with a DOS disk in it, isn't an XL/XE going to automatically go into self-test? After all, self-test replaced the "memo pad" mode that was on the original 400/800s.

# 3871. the moderation issue -- revisited

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-02 11:02:22 UTC
From: Roy G Biv <8-bitter@joysticks.R.us>
Message-ID: <Pine.GSO.4.53.0307020610100.11580@shell1>
Source record: 20534

On Wed, 2 Jul 2003 at 07:26:31 +0800, "Clockmeister" (gerryvdb at
tnet dot com dot au) scribbled:
->You are only speaking for yourself, his ads do not belong in this
->forum. No amount of rhetoric on your part will change that fact
->any time soon.

It's funny <ha-ha-ha> how the adults who responsibly post here
are "only speaking for themselves," whereas the juvenile trouble-
makers posting filth and personal attacks believe they own this
newsgroup, which thereby gives them the right to state the rules.
Oh, it's so funny <ho-ho-ho> -- not!

As I said some seven months ago at another peak point in
activity by the troublemakers, this forum needs to be moderated.
(And the moderator(s) need to be old enough to be mature, and cer-
tified to NOT be raving homophobes.)

Unfortunately, as far as I'm aware the bureaucratic rules and
red tape insisted on by the lords of the Usenet for creating news-
groups (and probably also for making changes) are cumbersome, time-
consuming, and tilted against practicality. As a result, proposals
have had a decreasing chance of success in recent years.

The road to floating formal proposals to be voted on by the lords
of the Usenet is paved with difficulty and frustration. Neverthe-
less, it needs to be done. We need to get rid of the troublemakers,
and moderation is the only way to do it. Without it, it's the decent
people who are leaving. Are there any volunteers out there to help
work on a project to get a moderated newsgroup?

An alternative, which might or might not be any easier, would be
the creation of a moderated 'alt' group. My ISP has said they won't
get involved in creating 'alt' groups, but other ISPS might possibly
take a different position.

Another idea would be trying to start up discussion somewhere
else (like what used to be called a "club," now known as a "group"
on Yahoo). I think that's doomed to fail. The Usenet is the only
place where there's going to be sufficient interest and participa-
tion to keep an Atari 8-bit newsgroup alive. But it won't survive
as long as the troublemakers hold sway. So let's get the ball roll-
ing for moderation! -- whatever it takes, and however long it takes.

# 3872. Re: dying 1050 drive

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-02 11:46:59 UTC
From: Thomas Richter <thor@cleopatra.math.tu-berlin.de>
Message-ID: <bdugnj$q29$1@mamenchi.zrz.TU-Berlin.DE>
Source record: 20535

Hi,

> I turn my 1050 drive on now and the lights come on and it fires up
> right, then the leds get dim and it just dies. It doesn't matter what
> power supply I try.

possible problem cases:

1) Voltage regulators bad. You'll find a 7805 and a 7812 regulator with
huge heatsinks left and right to the board.

2) Burned diodes. The 1050 uses internally a voltage doubling circuit to
generate +12V from the +9V power supply. This voltage doubler is built by
the three huge capacitors in the rear middle of the drive, and two tiny
diodes just between them. These two diodes are underdimensioned and easely
burn out if the drive is used excessively.

Greetings,
Thomas

Looking for somebody who would inspect and repair my aging 576k 130xe.
This device has several upgrades, including memory.. It has a multi-OS ROM
by CSS, Basic disable toggle, Super-Video, Super-Audio and a few others.

Lately, it appears as though something has gone south with the Multi-oS
ROM, as I can only use standard mode.

Any repair solutions appreciated.

Just some points from someone that does participate in a moderated forem.

#1 Is that they become clicks. That is nothing a moderator's butt buddies say is off topic, nothing a moderators butt buddies does is inappropriate, anyone that gets in a legitimate argument with a 'regular' has their posts removed as off topic while the regulars can respond to anyone with the same homophobe type posts our current mental case does.

#2 Is who do you trust to do it? Just as a for instance: Posts are only supposed to be made to the most appropriate group. There *is* an emulator group so all emulator questions should be posted there vs. .8bit since this is a hardware/8 bit software group. If you get a rule guy, they may not just enforce the rules you want them too but all the rules.

#3 Who has the time? Time will narrow your choices as to who admins #1 & #2. I think the list of people with enough free time on their hands to do the job would be limited to Ben Smith and the mental case.

Source record: 20543

Hello All,

The theory, at least, behind alt groups is that they are
"self-moderating." This means, in some cases, that when somebody posts
something outlandish or distasteful, the majority of posters in the
group jump all over it, prompting the following typical reactions from
the original poster:

1. He/she turns up the heat and comes back with personal
attacks on all who answered his first post; or,

2. He/she begs for sympathy, hoping that it will get more
attention. The tears flow like rain, the violin comes
out, etc. People who disagreed with the obnoxious poster
are now apologizing for doing so, and you can just
imagine what comes next..

Of course, there's the occasional group where outrageous posts are
simply ignored. That seems to work better, and most obnoxious posters
go away. If they don't, after a reasonable amount of time, some
member usually takes it upon him/herself to contact the obnoxious
poster's ISP and that settles the issue.

Richard and David have both made good points re: moderation, but I
tend to lean toward the idea that we can do it ourselves -- via
appropriate silence.

Take care.

Alan

I used a 20 meg MFM Seagate with a Western Digital RLL card. I did have to do a low-level format to get it to work though. This was after Seagate started including install software on a 5 1/4" disk in the box with their drives. The software made low-level formatting easy.

>I loved the BBS's back then and how each would brag in the opening

I remember one BBS using five 286's networked together. With two 50 meg drives in each box. He had five phone lines and a modem in each computer for a 5 node system. One line was free (and _always_ busy). It was worth ten bucks a year to become a subscriber and be able to connect on the other four lines.

Without holding down the option key on the XL/XE (excluding the 1200XL) you get the BASIC, READY prompt. If your computer goes into self test mode when you turn it on, without holding option down, regardless of peripherals installed, I'd say you have something wrong with the RAM.

You can carefully pull and reseat the chips and try the temperature test given earlier to try and find the bad one. I don't know how the little blocks in the self test correspond to the physical chips. Does any one know?

You practice an old tactic of evolutionists, known as "switching the burden of proof". But I say, since you're the one MAKING the claim of having sex with my wife, you should be the one required to PROVE it!

Afterall, I already DON'T believe you, so why don't you show me how much of a "missus porker" you are and tell me where she and I live, eh?

# 3895. Re: the moderation issue -- revisited

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-03 07:13:36 UTC
From: Roy G Biv <8-bitter@joysticks.R.us>
Message-ID: <Pine.GSO.4.53.0307030106370.21453@shell1>
Source record: 20560

On Wed, 02 Jul 2003 at 16:13:51 GMT, "richard cortese" scribbled:
->Just some points from someone that does participate in a moderated
->forem.

Your input is appreciated. In the past, under ordinary circumstances, I have not tended to be favorable toward the idea of moderating Usenet newsgroups. (Further comments below.) But this newsgroup has a history of longterm disruption caused by enemies of a particular dealer posting irresponsibly for years and years. The anti-Terry Ortman postings, e.g., continued for years after Ortman was long gone from this newsgroup (and long gone from Atari).

The juvenile troublemakers and assorted nutcases obviously have no lives (not to mention no brains), so they have to keep posting their filth; they don't have anything better to do in life. In the latter years of anti-Ortman postings there were signs that one or more of the anti-Ortman crowd were sending fake Ortman postings to this newsgroup just to keep the "issue" alive. Examination of the long message headers of postings in the current imbroglio causes me to be suspicious of the "legitimacy" of certain postings. But in any case, the bottom line remains that the troublemakers are determined to ruin this newsgroup by posting filth and personal attacks. As in the Ortman case, the troublemakers are going to continue posting their filth for umpteen years, because that's the only life they have. Something needs to be done.

->#1 Is that they become clicks.

The Bush White House uses the term "regime" for ruling groups they don't like. <grin> "Clique" is more esoteric. But I notice the dictionary definition doesn't indicate that a clique has to be negative. It merely defines clique as a small or closed group with shared interests. Any group of newsgroup moderators would inevitably fit that description. It's up to the moderators to act responsibly. And in the case where a moderator didn't act responsibly (or disappeared), I believe the Usenet rules allow for complaints to be filed, which could result in a change of moderators.

->That is nothing a moderator's butt buddies say is off topic,
->nothing a moderators butt buddies does is inappropriate,

I've followed two moderated newsgroups over the years, and they aren't like that. Both of those groups deal with areas of the broadcasting and media world, and there are many "important" people in those fields who follow and post on those groups. The moderators of those groups act responsibly, and thus make it possible for both

VIPs and ordinary readers to participate in those groups -- because those groups are expected to be free of spam, filth, personal attacks, and other unwanted trash.

I think this newsgroup has some similarity to those situations. There are many "important" people in the Atari 8-bit field who have participated here over the years. Programmers, vendors, and gurus are just some of the people who are important to the success of this group. Active users, on real hardware or by emulation, are also important. The 8-bit users deserve a safe and clean environment here. Moderation may not be 100% guaranteed, but it is probably the most feasible solution.

->#2 Is who do you trust to do it?

Well, I humorously hinted at two standards in my original posting. To be more specific, but still with a large dose of humor, I would suggest a minimum age of 40 and a requirement of a signed statement pledging to be as "fair" as, for example, last week's U.S. Supreme Court decision. (Which the resident homophobes on this newsgroup are probably foaming at the mouth over.) OK, I'm kidding about the age 40 thing (maybe it should be 60 or 70?!), but any candidates need to be (1) mature, and (2) fair.

->Posts are only supposed to be made to the most appropriate group.

OK. But how does that relate to the current problem? Should we be telling the troublemakers to post their filth on alt.filth? Or alt.unacceptable.lies? Or alt.ben.smith.die.die.die? You know, those would've been good jokes in Modemland ten years ago, but I'll bet most Usenet readers today don't even know what that joke is about. But technically, it would be correct to say to the troublemakers, "You should take your filth to alt.filth, and if there isn't such a group, you should start it." Will they heed that advice? I doubt it.

->There *is* an emulator group so all emulator questions should be
->posted there vs. .8bit since this is a hardware/8 bit software
->group.

There are 49,820 newsgroups currently listed as available on my ISP. I checked all groups with the word "atari" in either the name or the description, and found no Atari group having anything to do with emulation. In fact, the only other 8-bit oriented (English-language) Atari newsgroup was alt-no-advertising.files.warez.atari-8-bit. Not only were there no postings in that group, but it's name ("warez") implies an orientation toward, or toleration of, illegal activity. So it appears that this is still the only Usenet newsgroup for all kinds of discussion (in the English language) regarding Atari 8-bits.

->If you get a rule guy, they may not just enforce the rules you
->want them too but all the rules.

Such people usually make themselves unpopular and don't last
long! <grin>

->#3 Who has the time?

No problem. I'm sure there are responsible people out there who
would do it. However, as I said, I think the Usenet red tape is a
bigger obstacle. I think the biggest question is who has the time
to delve into all the bureaucratic procedures that are required and
actually do the work needed (i.e., red tape) that the Usenet rules
call for? Are there any volunteers?

Perceived.

The old toaster Macs did have a warning about placing an external floppy drive on top of the computer, or on a stand beside it at the same level as the monitor. The internal drives were never a problem of course, since the designers _knew_ where they would be.

It started as an orignal oss cart :) and still has the shells and the board.
only differance is the eprom, 2 resistors and 2 switches :) the basic XL
was the tricky part Only had a version for the 2 eprom oss cart, where as
mine is the single eprom version. they both have differant addresses in
which the banks are selected. had to go through and find the address's
($D5XX) and change them so it would bank switch properly.

Well nomen is a well known troll who's 'thing' is disruption. He's kind of
all over the place with paranoid rants. Hard to tell if he just has a sick
sense of humor or is genuinely sick. Sick is the keyword anyway. I'm not
even sure if it isn't a kibo kind of thing.

alt.emulators is where people wanted to stick them.

I would estimate around 1/3 of the newsgroup was against emulator talk in
comp.sys.atari.8bit due to the nature of their contribution. Most of their
posts were ~How come there aren't warez sites for Atari like their are for
the C64?
~How do I get the emulator to recognize my Gateway built in video card?
Which was kind of tough to answer since most people had real Ataris and
didn't fool with the emulators.

I can't remember a single post from anyone other then an emulator user that
wanted them here, but they came anyway.

I'm sure there are qualified people but the rub is the time it takes.

Try a different joystick.

Look at the pins in the socket, make sure none are bent.

Try running a BASIC program to loop and print the value of the port..Print
stick(1). It should read 15 with no stick or not pushing the handle.

It could be the pia(6520) or the resistor or capacitor for that direction
line. Looks to go to pin 4 of the pia.

You attempts at "slight of hand" are futile. The statement is to have HIM
(Steve Sweet) PROVE (provide overwhelming or undeniable evidence) that he
knows where I and my wife live. But maybe you don't know how to read
English (or suffer from some variation of dyslexia) and thus are lead to
believe I meant something else entirely different.

Make sure the cartridge contacts are clean. Same for the socket.

You may need to open up the cartridge or 400 and reseat all of the
socketed chips.

You know, Ben, not to be mean or anything, but...

Didn't you just post this exact advertisement last week or so?

Hyper-repetition is not going to win any converts/buyers over any faster.
And I think upgrading and repairing your site and providing an URL to it
would yield far better results.

But, if you're doing it just to annoy the blazes out of all the lamers here
that are attacking me... go right on ahead. ANNOY THE SHIT OUT OF THEM!!!
WHA-HOOOO!

Oh, and send a few dozen ads to "Anonymous"... just to put a few more fleas
in his hair and annoy him tremendously!

Jus' my $0.02.

The only thing I can suggest to clean the contacts of the serial port
module and pofo bus.

HAving no repair docs, looking for a replacement serial module now would
be a good idea.

Well,
the crash took place from 1983 to 1985. Read how many millions Atari
lost in 1983 and 1984 (until the Tramiels took over; the losses were
smaller then and somewhere in 1985 Atari was on the plus side again).
Some companies already got busted in 1983, some survived until 1984.
think, after 1985 the great homecomputer crash was over...

Message-ID: <3F047F6B.56684491@students.uni-mainz.de>
Source record: 20578

Fortress !!
Game was done by a brit, had a nice intro-picture with a small animation (alas, the game mostly crashed after that intro, so I removed it). The game featured "ripped" sounds originally done by Kemal Ezcan. The full length of the file was 279 single sectors - after removing the intro and packing it with DJ-Packer my version now has 78 single sectors and still plays fine. Alas, a two-player mode is missing... -Andreas.

P.S.: If you miss the highscore table in fortress, you can create a new one by choosing the option ERASE Highscore (and no, after the game created a new one for you it won`t erase it immediately)...

You think it would be doomed to fail to use a group? Check out
comp.sys.ti - pretty much dead. Then check out the TI group on Yahoo!
(http://groups.yahoo.com/group/ti99-4a/). Look at the activity (#
messages per month) at the bottom of the page. There are over 500
members there.
It just takes someone to setup the group, advertise it, post rules and
throw-out the losers. It will eventually become self-moderating, with
just occasional problems.
Plus there are benefits like a chat area, files area, and links
area...

Ben

AtariAge does a pretty good job for atari related messages. Granted, there
is more than just an 8-bit forum, and it is an HTTP based forum which can
sometimes be slow..

Another group I used to read has made the progression from UseNet to web
forum and it has only been good for all concerned. Well, not for the
trolls and losers who can't seem to figure out that their crap is not
wanted. They find out soon enough on the web forum when they are booted.

OH, FOR JOY! I MADE THE LIST! I AM SO HAPPY! MY LIFE IS COMPLETE!

Now, let's see here... who can I tell this wonderful news to!

Steve Sweet? No... he's too busy porking my wife and sheep (hey, I don't recall owning any sheep!)
Clockmeister? No... he's too busy agreeing with Steve.
Anonymous? No... he's too busy trying to convince the entire atari.st newsgroup that Benjamin Smith is a 400lb GAY salesman.
Everyone else on this newsgroup? No... they all think I'm crazy for trying to get Atari to make hardware again.

Rats... can't think of anyone... guess I'll just have to keep this wonderful news to myself... :-(

> Shawn Jefferson
> (fix reply to for email)

At one time I had it figured out but there is a basic flaw in straight
thru thinking that makes it all not apply. First there is a hole in
ram that is not tested, 3000-3800 or somesuch that holds the results
and then ram under rom is not tested, nor 5000-5800 as that is ROM
while the self-test is on. So each block doesn't map out to a linear
feild as it is displayed as such to start with. Then there is the fact
that each ram chip is responsible for only one bit of all addresses
possible which in my mind at least ruins any chance for 'reading' the
screen results and drawing any conclusion as to which chip to replace.
Much better and far more accurate to replace the ones that burn your
finger.

The default behavior for a standard 800XL is to boot to Basic if there
is no disk drive attached. However problems with PIA can sure cause
self test too - but the test shows bad ram so start there I say. I'm
thinking that if you boot with Option down and you don't have a disk
drive attached - then you get self test on a standard 800XL.

> progressive JPEG`s; I don`t know, since I merely have an old 486 PC
> which almost has the same problems as the A8 - at least with displaying
> newer JPEG pics)...

JPEG2000 is something very different from the "traditional" JPEG and,
except for the name, is not at all related to it. (Ok, it's standardized
by the same ISO group, but that's it.) I pretty much doubt there's a
JPEG2000 codec for the A800, actually.

So long,
Thomas

Hi,

> Something know how can i terminate the game in atari 8 bit ?

"terminate"? I suppose you meant how to solve the game?

Anyhow, there is no ending in the first "never officially published" game
by Utopia. It was a beta release and had a couple of bugs.

So long,
Thomas

->and throw-out the losers. It will eventually become self-moderat-
->ing, with just occasional problems.

Based on what I've seen others do, setting up a new group on
Yahoo is easy compared to what the Usenet demands. But the groups
I've followed on Yahoo that have small followings have almost all
dried up. I'll have to admit, tho, that I haven't seen any of the
organizers of those groups do any "advertising."

Message-ID: <qd5bgvov6o3v31d3rlhk2i5pi34ueugk1e@4ax.com>
Source record: 20455

I have gone through the rigamarole and bureaucracy of starting a
Usenet newsgroup (comp.sys.amiga.morphos) and I can tell the
uninitiated: it is one heck of a lot of work and about a million
things can go wrong and in the end you might be unsuccessful.

The logical name of a new newsgroup is "comp.sys.atari.8bit.moderated"
I think.

I have read comp.sys.atari.8bit for several years. It was actually the
first newsgroup I ever posted in IIRC. It is a shame that we have to
consider this.

I think what may happen is that we endure until the offensive person
finally tires and goes away (no way of knowing how long that will be)
and lose disgusted participants all along the way. Or someone makes a
heroic effort to terminate his access by cybersleuthing the correct
organizations to complain to, writing passionate complaints to
convince the anonymous remailers to give him the boot, complaining to
the authorities to the extent that libel or whatever has been
committed, and so on. But these anonymous remailers... you have to be
frickin' Osama bin Laden to be kicked off these anonymous remail
services, being Jeffrey Dahmer is not nearly bad enough.

If one section of your OS ROM works correctly, I would expect that something is wrong with the ROM itself, since the rest of the hardware cannot tell which OS has been selected. If it were something else in your machine, it would work on all or none of the OS selections.

I have seen more that a few EPROMs do this - they do not seem to get burned completely...

I have one. Can you please repost the question. All this junk has caused
the original question to scroll off.

Thanks,
Mark

## 3955. ATR Co-Power 88

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-05 04:14:01 UTC
From: llppwhite@aol.comnsp
Message-ID: <20030705001401.23626.00000177@mb-m04.aol.com>
Source record: 20467

While checking my ATR-8000's for the type and configuration of the hard drive boards, I noticed that the second ATR's hard drive daughterboard was different -- in the Z80 40-pin socket there was yet another daughter board, with a small ribbon cable going beneath the ATR mainboard. Peeking under it with a flashlight, there was another board, maybe about 7" X 7", with a cream-colored Intel 8088 processor. This one says "KayPro 4" so I presume that it is configured as a KayPro CPM machine. (?) Anyone ever use one of these Co-Power boards, and is there any use of it for the Atari?
Larry

I don't mind facts but what I was saying to Luke is that he went, he
purchased and he got what he wanted. But then to describe the persons
house in that way isn't stunningly nice whatever you think about the
person.

It's like you coming round to my house, buying an item, being happy
and then writing on the net "Oh I got what I wanted but he's a bit of
a mong and his place is a shit hole".

Both untrue I might add ;-)

What I was saying to Luke is that he wasn't actually answering the
question in the subject, he was making observations about his
belongings. His comments re his thoughts on Ben's mental state are not
the deal, that's his opinion of Ben and I've never met him myself so
it's not for me to say what he's like although his adverts don't
exactly do him proud.

Wow, tks for the reply Mark.

I have one and when I attached it I lost the function in ATRMON which
was present with just the z80 chip in place.

When I got the board, the pin connectors that attached the loose wires
on the board were in bad shape, so I replaced the connectors (two
seperate strips) with a new 40 pin socket. The socket connected fine
but the board then didn't work.

So looking at the daughterboard oriented with the SWP copyright at the
bottom, at the top left there is an empty 16 pin socket. I wanted to
check and make sure this socket was supposed to be vacant before
trying some other diagnostics.

Tks

## 3966. Atari 5200 vs. 7800 - which to buy?

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-06 02:54:53 UTC
From: sark314@hotmail.com
Message-ID: <2ab25086.0307051854.155a2187@posting.google.com>

(I couldn't think of a better newsgroup to post this question to than this one; if such a newsgroup exists, please direct me there.)

I'm looking into buying either an Atari 5200 or 7800, because I want my retro, and I don't want it on a freaking emulator.

What I've read about the 5200 is that its sound is better than that of the 7800, which used the same sound chip as in the 2600. Basically, if I get one or the other, it'll be a trade-off -- superior graphics on the 7800, but inferior sound, and superior sound on the 5200, but inferior graphics. My question is: *How* superior or inferior? Is the sound really that bad on the 7800? Are the graphics that horrible on the 5200? Screenshots don't tell me everything I would like, I guess. Probably these questions can only be answered by someone who has played or observed both systems. A lot of the games I'm looking for will be arcade ports, so I'm wondering how close to the original those come on each console, too.

> come on each console, too.

In that case, I recommend you to purchase the 7800. Although there are not
too much games in that console, they are in very good quality, and a lot of
them have the POKEY sound inside the cartridge (the same sound chip the 5200
has).

Further information you can find on www.atariage.com They have a complete
list of which games had been produced and *maybe* you can find some you have
an special interest.

Wilheim.

Feedback on Bravo Sierras (Ben Smith's) sales.

Bravo Sierra Computers wrote:

> Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari
> Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari

You've seen his adds and sometimes referred to SPAM.
I'm a recent customer.
Sorry, not a regular poster here and don't have time to catch up on all the posts either.

Here's my feedback for you about Ben's sales - some good some bad.

Negatives:
Advertises too often, possibly considered spam to the newsgroups.
The information on his site makes him seem to be less reliable than a typical dealer.
- ie typos and poor grammar etc.
The same goes for his business emails to customers - a bit confusing at times.
Does not always reply back to the question or questions you ask.
- possibly just too busy with orders and emails.
Does not have a great system for keeping his inventory, but not too bad - he'll work it out eventually.
Does not accept personal checks, takes US postal service money orders only.
- this adds extra cost to each customer.

Positives:
There are not that many folks selling (trading/buying) Atari computer merchandise.
- so one has to factor in that into your search for Atari computer products.
Prices are not too bad, and he has a decent variety. Some loose and some NIB etc.
Also carries a bit of C64 and other computers from that era - not just Atari.
Usually replies back within a day, and will eventually figure out what you want.
He did not have a reference list or email addresses for his previous customers
- but he does now have some as I checked him out in advance.
- I didn't check his online site to see if he revised that.
He emailed the status of my payment and order being sent out.
Packaging was fine. Shipment arrived quickly.
Merchandise as expected and fine.
Shipping costs minimized if you want media mail.
He will insure and use priority mail if you do want it.

Other considerations:
I purchased from within the US.
I am somewhat well known to the classic gaming community and so perhaps he made more effort
and care to my order than the average customer.

Recommendation:
Yes, place and order.
It would be worth your effort - but perhaps make it smaller (< $50) at first.
Make sure to go over every detail and do not assume anything.
Verify all items to be purchased and price and shipping and totals.
Save your email messages and his.

I hope that this helps potential customers.
His service may not be as good as other reputable dealers, and a bit confusing in communicating with him, but my experience was good.

Alan, "Pitfall Harry" Hewston

Although there are a lot of people who write in spanish in their day-by-day life (including me :-)), I would not recommend you to post in our language here. There are a lot of people who lives in different countries and they do not have have too much experience with spanish (Like me with dutch, for example :-)) So, next time please write it in english.

About your question, there is no end in Montezuma's Revenge (called Montezuma II in Chile). Looks like it was a preview version from Utopia Software that must be never published. And it has a few other bugs around here. (Ghost rooms, ladders, skulls, etc.)

Hope I helped. Greetings from a fellow countryman!

Wilheim

P.s: The same answer in spanish:

Sobre tu pregunta, el Montezuma II no tiene final. Al parecer fue una versi&#65533;n de prueba que Utopia Software nunca debi&#65533; publicar. Incluso tiene algunos otros errores.

Espero haberte ayudado. &#65533;Saludos de un compatriota!

7800 vs 5200? The controllers of the 5200 are so bad (plus so difficult to repair) that I won't turn it on anymore. The 7800, on the other hand, is just fine. I'd recommend the 7800. If you like some of the 5200 games, just buy a 400 or 800.
-Dan

Yeah - those 16 colours really were advanced in 1983. All the Atari
computer owners are probably laughing their asses off at this statement.

The C64 was one of my favorite systems. Best developers, best games,
terrific sound. But your statement above is SILLY.

You seem to be forgetting that sprites were implemented in hardware, as well as collision detection in hardware, and other nifty features. All of which explains your statement above about the C64 having good games. :-)

I use Entourage, which is Outlook on steroids and it works pretty much the same way. The TO: field is easily changed with a click or two.

I can write a small tutorial on filtering out unwanted posts with these apps if anyone is interested in that.

It's really easy actually.

The 9918/28 had 32 hardware sprites and 16 colors. Long before 1983

I simply don't understand this...:

1. Ben Smith's posts are cleary marked as ads, and very easy to filter
out if you don't want to recieve them.

2. He uses a real return mail addres so any complaints can be sent to him
direct. As he actually has stated that he does not read this group
regulary a followup to the group is simply stupid.

The only logical conclusion is that these people (Clockmeister, Mark D,
smeg, etc..) tries to form a mob against Ben Smith among the readers of
the group.

This behaviour is against all usenet netiquette and a far more serious
violation compared to posting any amount of ads. I personally find it
disgusting to watch and would like to meet any of you in person to take
proper actions!!

I surely doesn't need to check my ISP. I get all the traffic I want to
have, that's for sure.

> smeg, etc..) tries to form a mob against Ben Smith among the readers of
> the group.

I simply am forced to add these people to my filters as well, takes only
a second to do so. The traffic on my end is very low after removing
certain people who can't seem to just drop it.

> This behaviour is against all usenet netiquette and a far more serious
> violation compared to posting any amount of ads. I personally find it
> disgusting to watch and would like to meet any of you in person to take
> proper actions!!

The problem is not really Ben. What you have is an outsider that has
found something that stirs up the group. The anonymous poster clearly is
not an avid Atari user or friends with anyone here. If that was the
case they would limit the verbal attacks only to Ben. However, anyone
who replies ends up in the sick story line. The problem is more along
the lines of sinclap, an individual who clearly has way to much time
as some grudge against Atari.

I understand the problem, what I don't understand is why certain people
don't just turn on a few filters. I seen a thread about moderating this
group and I don't think that would really help. The easiest thing to do
in my opinion would be for everyone to sit down for a few minutes
and read the darn manuals to their news readers and fully grasp
the concept that they can control what they see. It's seems the easiest
path is always the less taken one. ;o)

Your mob is trying to lynch us for expressing our opinions. If Ben employed
proper netiquette we wouldn't be having this discussion in the first place.

> This behaviour is against all usenet netiquette and a far more serious

> ribbon cable. I made sure the contacts were good. Do I need a new
> mylar?

I had this problem about 12 years ago on mine. I got nickel paint and used it to repair some traces on the sheet, but it never really worked out for very long.

I ended up hacking an old AT&T PC keyboard (separate from the CPU, like a PC). I broke the keyboard open, traced out the key matrix, compared it to the Atari, and realized I'd have to cut all the circuit traces and hard-wire the thing.

So I did.

I stripped the insulation off a length of lamp cord, separated individual strands out, and soldered them one at a time to match the Atari matrix. Since they're bare wires, I went through at least one roll of electrical tape to insulate things.

The wiring terminated at a 25-pin connector (a PC printer port, female). This is bolted to the back of the AT&T case.

On the Atari end of things, I removed the keyboard, de-soldered the connector at the motherboard, and soldered a 25-conductor ribbon cable in. The other end is a male 25-pin connector.

Yeah, it's ugly, but it works *g*

Hi all,

I just joined this NG, so please forgive me if this question has been asked before. I am from the old school, and my first computer was an Atari 800 (BIG mistake getting rid of it). My life came back into focus when I found an emulator (Atari800Win31), and I found most of the software that I once had. Some games, however, I was only able to fine monochrome versions of, when I distinctly remember them being in color. Specifically, I am referring to the games Ultima II-IV (I is in color.... go figure). I am wondering, is there a color version out there? TIA!

If djpeg and cjpeg are installed then chances are jpegtran is too, you
can save a bit of typing with:
jpegtran -greyscale orig.jpg > grey.jpg

That same line will also convert progressive JPEGs into baseline JPEGs
that the Atari decoder can display.

While it's a good idea to convert colour JPEGs to greyscale (it makes
them smaller and they will decode faster), the decoder should be able
to handle colour images without converting them first, the colour
information is just discarded.

> there? TIA!

Those games appeared in color due to 'artifacting' of the pixels at high resolution.
(320 x 192 mode; the same pixel size as pixels in the normal text mode, FYI)

On my Atari 1200XL, in high-rez mode with black background and 'white' (actually
'brightest,'
since the color depends on the background) foreground, pixels looked like this:

.#.#.#.# Blue
#.#.#.#. Red
######### White
...##... White (bluish tinge on the left, redish on the right)
..##.... White (redish tinge on the left, bluish on the right)

I may have got the red and blue mixed up. On the 400/800, I think the colors were closer
to green and brown, as well.

What you want to do is run Atari800 with color artifacting ENABLED. This reduces the
sharpness and quality of text and stuff, but more accurately depicts the colorful artifacts
used in games like Pinball Construction Set, Ultima, etc...

I'm not certain how one does that in Atari800Win, but it should be pretty obvious. ;^)

NOTE: At least with one of the later versions of Atari800 I've tried (SDL version for
Linux),
I noticed that the color artifacts are ALWAYS a certain brightness, so if you do something
like this:

```
GRAPHICS 0
SETCOLOR 2,0,0
SETCOLOR 1,0,4
```

The 'white' pixels will be very dark, but the blue and red artifacts will still be very
bright!
It looks horrible! :^(

Sprites and collision detection were done in hardware on the Atari 8-bits, too!

C=64 sprites seemed to be more versatile 'out-of-the-box', but there were some pretty damned
cool tricks you could do with those screen-length (e.g., ~200 pixel tall) 'players' and 'missiles'
on the Atari, too. ;)

For some games, you will need to turn on "Artifacting" in the
emulator.
For Ultima IV, I know that you must find the "Enable GTIA Artifacting"
or "Enable CTIA Artifacting" check boxes (I cannot remember exactly
where they are at the moment).

These games used a byproduct of how the Atari outputs video to the TV
to create more colors than would otherwise be possible.

So, there is a color version out there, and more than likely you have
it already! :-)

I hope this helps,
Chris

Thank you all...:-) Found the artifacting controls, and found that my memory is not all that I like to think it is (that's what happens when you get old, I guess). I do get the colors (sort of), but the screen becomes relatively blurry.... Me thinks it better to leave the artifacting emulation turned off (look better that way).....:-)

That is exactly why I am getting these chip's. I am going to set up a 1088k 600XL. Want to get 64k working first. Surplus store's that handle 4464 chip's would be a rare beast indeed. But thank's any way.

bg micro has them.
they might ship to Australia, but it would probably
be prohibitivly expensive.
4464-80 ns $2.75 (US) each.
Best Electronics almost certainly has them, but again
shipping!
www.bgmicro.com go shopping and search 4464.
http://best-electronics-ca.com/
I bet Lance of Video 61 could pull them out of a busted
computer, or BEN SMITH maybe.
I've got a 800xl motherboard I bet has good ones in it,
and they're socketed! I'm looking at them, they say
MB-8264-15 _
8348 I42 BG manufacturer F_ (underline)
wonder if those are the same?
Then you might try B&C, they might have them.
http://www.myatari.com/
Just an excuse to plug a few A8 vendors, heh heh.
You can consider this an advertizement. All these
pay me to say this stuff.

How many of these has your board got, and how many pins do they have?

If it has two, and they have 18 pins, they may well be 4464 chips.

If it has eight, and they have 16 pins, they are 4164 (64k x 1 bit) chips.

I've got an 800XL and it has the latter.

# 4012. Re: 4464 ic's

"Son of man" <bcozier@bellsouth.net>:
>I mean what's the advantage besides the 64k vs 48k ??

The 800XL:

has BASIC built in, which forces you to hold down option to disable it with almost every game.

uses the same OS as the 130XE which makes memory upgrades compatible, and able to be used by any software that supports 130XE extended memory.

international character set, anyone ever use this?

smaller case design

RAM under the OS which some software uses (SpartaDOS, TurboBASIC)

one cartridge slot located at the top of the unit with no need to flip open a lid, and no confusion as to which slot to put the cart in. ;)

I like the 800 better, but there is just a lot of software that makes use of the extra "RAM under the ROM" of the 800XL, and if you want to run that software you really need the XL. There are also hard-drive expansions that make use of an... ummm, port or something that is only on the XL. The 800XL was the final "baseline" for the Atari 8bit, in that the later software was programmed with it in mind. At least that is my understanding.

The 800 had four joystick ports though so it was a good party machine. The 800 had the extra cartridge slot for a real-time clock. Also, the 800 was a tank! I'm a proud 800 owner.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> international character set, anyone ever use this?

Hardly. At least for german users, it lacks the german "sharp-s"
(sz, written ï¿½ if your news reader supports the ANSI-Latin character set).

The Os had a couple of enhancements and bug fixes. (Optional smooth scrolling,
SIO,CIO and S: handler fixes and the parallel port support).

Greetings,
Thomas

I've seen such cables here. I also remember that I've heard that some
TVs (not all) accept S-video on scart and such cables could be also
made.

</nitpicking>

No, if you have eight of them, they are 64K x 1 bits.

They were just made by a manufacturer (Mitsubishi?) that decided to use a
slightly different part numbering system.

I have several XE carts that when inserted into my 130XE will not work unless I only plug them in half way or jiggle them a bit! I noticed other non XE carts work fine when shoved all the way in! Anyone have the same problem?

On my 800XL this doesn't happen so maybe it's the combination of the XE and XE carts! You would think it would be other carts and not the carts made for that model!

Yup, I've noticed the same problem, in two different 130XE computers.

I like a laugh so here it goes

computer house, computer house, computer house

Additionally didn't computer house manufacture and market something similar to derek firn/microdiscount's floppy board device (but severall years b4)

I don't like to swear paul so here goes

computer house, computer house, computer house!!!

lastly what part of this great island do you come from (and please don't say manchester)

yours Atarily

Sorry for going off topic, but seeming as we are all using this 'great amaerican' invention to discuss things atari, I recently found out something interestion about the beginnings of internet/apranet

According to a programme (late night) I was watching on BBC 2 which was discussing in internet and www etc

although they said that the internet was largely designed and developed by the americans (through the apranet project) some of the important technologies and technical aspects of the internet (and apranet) where largely british inventions such as packet technologies and packet switching amongst other things, and not forgetting our friend Mr Berners -Lee who gave us www and hyperlinking technology (again british born, although working at a major european institution at the time of his discoveries)

Lemme put it to you this way. I have a new 1200XL and a new Atari
800....there's a new 800 XL on ebay and was wondering if there was any
advantage to getting it for any reason...for example I know the artifacting
on my Atari 800 gives the proper colors for ultima 3...will it be the same
on the 800XL?

My stupidity, I apologize.

Explanation:
The EURO connector, SCART (Syndicat francais des Constructeurs
d'Appareils Radio et Television) was developed by frech company called
Peritel.

See for example here: http://www.sparkysworld.co.uk/connectors.htm

I would get the 800XL! Its small and compact and stable computer! Was very
popular and it is better in a lot of ways than the 1200XL. The only think I
like about the 1200XL is the KB, recessed Cart slot and slanted joy ports,
the 800XL is smaller, better OS, Expansion slot, built in Basic. Top
loading cart slot. Nice to have...

# 4037. Atari 8-bit video quality observations

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-10 21:31:19 UTC
From: Son of man <bcozier@bellsouth.net>
Message-ID: <JKkPa.381$UK.331@fe02.atl2.webusenet.com>
Source record: 20350

I have a new Atari 800 I used the monitor port with my hdtv which upconverts all inputs to 1080i

The quality was great, and I coul even tell some slight red artifacting on the edges of the READY prompt.

I have a new XE GS which I used the built in composite out port and to my amazement while I thought the 800 was great this was by far the best. Really better contrast between the letters and the bakcground. Very bright a perfect -- the reference in Atari video quality. It looked professional, like I could use a word processor and write a with it...

Then I tried my new 1200XL with the monitor cable again...it was clear on my TV but the contrast was weaker than the 800 still of course perfectly doable and no complaints if I hadn't seen 800 and XEGS performance.

So from my observations the XEGS with built in composite out was the best and looks professional enough to do some serious word processing if you're so inclined.

The Atari 800 comes in next and looks damn fine on it's own, it loses some points when compared to the XEGS....and the 1200XL loses video points when compared to both.

I agree, sounds like I should try to get it. I only wonder how the video
quality will compare, do you know if it has a monitor port? So far the XEGS
has the best video quality output. But to my memory it doesn't artifact
ultima 3 with the correct blue/brown. Instead it's pink and green I think.
That's why I got the 800. I'm so glad to have these brand new unused
condition when I got them, and they are still the same mint condition today.
I also have the original boxes and packing and manuals. Good stuff.

Yes, it was built and created by 2 people I knew, Mike Morgan and Dave
Tuttle. Mike was a software guru and Dave was / is a electronics wiz.
They made this item and John offered to market it under Computer
House, mags like my lot (Atari User) were sent samples and it got rave
reviews and genuinely was a fantastic product.

Sadly Dave and Mike never got a penny as confirmed by Dave a few weeks
ago when I chatted to him. Computer house had no hand in the making of
it, John wasn't even technical in that way iirc.

A shame as Mike and Dave were really nice guys who had the misfortune
of meeting this lot, lets just say that CH did some nasty little
things.

# 4040. FA : Cheap boxed+sealed XL/XE carts

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-11 00:37:33 UTC
From: Ulrich_Sternaxe@gmx.de
Message-ID: <f16cbc23.0307101637.286706c9@posting.google.com>
Source record: 20353

Look at :

http://cgi6.ebay.com/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=klassische-videospiele&sort=3&page=1&rows=25&since=-1&showpics=1&stab=0

Everything is "buy it now" and the prices are really low for boxed,new + sealed games , this may be the last chance to get factory-sealed ATARI XEGS carts.

I have for example :

XEGS carts (48K req. , some 64K only)

Airball - classic 3D isometric action-adventure
Thunderfox - great space - shooter with superb music and graphics
Lode Runner- classic by Broderbund
Ballblazer - classic game by Lucsfilm Games
Rescue on Fractalus - classic game by Lucasfilm Games
Archon - classic game by Electronic Arts
One on One - classic Basketball game by EA
Davidï¿½s Midnight Magic - pinball game by Broderbund
Star Raiders 2 - classic game by ATARI
Crossbow - Lightgun - action-game
Crime Buster - another Lightgun - game
GATO - submarine simulation
Hardball - classic Baseball game
Ace of Aces- flight-simulation

XL carts (usually 16K required):

Pole Position - Racing game
Moon Patrol - classic arcade game
Robotron 2084 - classic arcade game
Joust - classic arcade game
Tennis - ATARI Tennis for 1-2 players
Millipede - classic arcade game
Eastern Front - strategy game
Final Legacy - action-game

All the games are BOXED , new , factory-sealed , in great shape.

I can ship worldwide and will accept PAYPAL.

I may also sell games without ebay , so if an auction has ended ,you may still ask if the game is still available.

I may also sell to traders.

I also offer lots of boxed/new ATARI 2600 games.

MG

# 4041. Simple Assembler

http://www.howell1964.freeserve.co.uk/parts/DRAM.htm

There is a slight difference in Address line numbering.
This will not matter for the 4464.

However, the TMS (Texas) 4416 has a 6-bit row, presented on A1-6 IIRC.
A0 and A7 (pins 6 and 7) never needed any Row address bits.
So in theory you should be able to connect those pins permanently to the
column address bits and only need 6 bits of address multiplexing.

# 4046. Re: Someone tell me is 800XL better than 800?

Agreed, the 5200 sticks are some of the worst controllers ever designed.
Get a 400 with a 48k upgrade, it'll take abuse better than an 800, IMHO.
And the yin to the 5200 controller's yang is the Epyx 500XJ, those
sticks _rule_.

No kidding it's a tank, I took mine to college to introduce the ivory
tower set to M.U.L.E. and one Friday night someone knocked over a full
pint of Pfeiffer directly into the keyboard. Pulled it apart the next
day, wiped it down with just water, let it dry out, threw it back
together and we were colonizing again on Sunday night.

Someone mentioned back in the day that the right-hand slot was also for
a light-pen application that never really got off the ground.

->>I mean what's the advantage besides the 64k vs 48k ??

To which on Thu, 10 Jul 2003 at 04:16:35 GMT, Shawn Jefferson
replied:
->The 800XL: has BASIC built in, which forces you to hold down
option to disable it with almost every game.

Built-in is useful but not essential. Incidentally, there are
other uses for the 8-bit besides playing games! (Believe it or
not! <grin>)

->smaller case design

A big plus.

->RAM under the OS which some software uses (SpartaDOS, TurboBASIC)

I.e., the fabled bank-selected 4K. I for one have been able to
get by as an 8-bitter without ever having to make any use of that
"extra" memory. I've been using XL/XEs for the last dozen years or
more, but that's mainly for OS compatibility.

->one cartridge slot located at the top of the unit with no need to
->flip open a lid, and no confusion as to which slot to put the cart
->in. ;)

Well, I don't think anybody back in the glory days of the '80s
was ever "confused" about which slot to put cartridges in. But
anyway, there was one downside to eliminating the lid: without the
cart slot lid, you can't run the old "cheat" Cartcopy program,
which made it possible to copy some cartridges with the lid propped
open.

Perhaps the biggest advantage of the 800XL is in comparison to
the 130XE: its keyboard. A decade ago, when I was still actively
using the 8-bit, I ditched the 130XE in favor of the 800XL because
of the keyboard.

Of course, it goes without saying that an XL or XE is necessary
because after circa 1984 all programming for the 8-bit has been
intended for running on the XL/XE OS, not the 400-800.

I know the CAT novation acoustic couplers took 9VAC. That's the same as the 830 Atari unit I think. I don't know about others, I'm sure that's not too far off.

>Shawn Jefferson
>(fix reply to for email)

Just to play devil's advocate here:

I own both and prefer the 800 to the 800XL - here's why:

1. Best damn keyboard I've ever used, to this day. Typing on that
thing is a dream...the 800XL keyboard is nice but the 800 clobbers it.
The only keyboard that comes close, IMHO, is the one on the 1200XL but
just try to find one! On the other hand, the 65XE/130XE/XEGM keyboard
is the worst I've ever used - how anyone can type anything on it is a
mystery to me.

2. Like other posters have mentioned, it's built like a tank. I
still have my original 800 from 1980 - the thing has had more
beverages spilled on it that I could count and has been dropped
several times, still works like it's brand new. Damn, if they only
built things to last like this nowadays...

3. I like the internal speaker!

4. Using the "Monkey Wrench" cart in the right slot rules! Being able to enter a ML monitor "on the fly" was a great way to interpret and remove protection schemes. Or so I've heard. ;-)

5. Function keys (Start, Reset, Select, etc.) are much nicer and are hard to hit by accident. Can't tell you how many times I've reset my 800XL by accident while playing games. I seem to remember doing this all the time when I was playing "Gateway to Apshai."

And finally...

6. No need for a translator disk! I remember the day I bought my 800XL, brought it home, tried about 10 games and not one of them worked. Then I find a coupon in the box which I have to mail in in order to receive a translator disk, which should have been bundled in the box (it was with my 1200XL!)..

Boy, does THIS bring back memories. You are 100% correct. I spent more than a few hours typing that in, only to find it riddled with bugs. I had enough understanding from debugging on how it was supposed to work so I wrote my own "simple" assembler. Now at this point, I had absolutely no idea on asm source code and had only programmed a few rudimentary BASIC programs, mostly graphics stuff ( a crappy mode 15 paint program and a few demos, one lame game). By the time I was done writing the assmebler... well let's say that... that was my education on writing assmebly code. All the LDA, CMP, BEQ, ROR, etc.. :) I had to understand what these were and what they did... at least somewhat.

The Simple Assembler (theirs and mine) isn't really a great tool. It just parses a string and pokes the values into memory. A real two-pass assembler is a much better tool and you should seek one out.

> Anyone have a copy? Can ya post it or maybe email it to

I am sorry but I have no way of getting my simple assembler to my PC for upload. I am not even sure of it's where-abouts or the integrity of the disk it's on. I haven't used it in... oh 17 years !!! I just wanted to alert you to the fact that yes... the Simple Assembler in the "Machine Language for Beginners" book is buggy.

If you can put together a homemade video cable to convert from the
Atari's 5-pin video port (using the luma and chroma lines) to the
S-Video port on your TV, the result is a very sharp picture, much better
than composite.

The 130XE has the best stock luma/chroma video output of all Ataris.

I have seen Curtle carts for the 2600, and I was thinking would it be possible to build a small solid state device that would plug into the sio port on the atari computer that would load any ATR file that you put on the device.

Basicly you are fooling the atari into thinking that the solid state sio device is a normal floppy drive and when you turn the computer on it will boot what ever atr you loaded on it.

maybe load 2 atr's and use a switch to access the second atr, that might help on two disk games

The 800 has the best overall video, including s-video (in my opinion..).
Your results vary according to which monitor you have. I spent a week trying
to correct a video problem on a Commie 1702 before I discovered ALL Commie
170x monitors have trash on the rising edge of hsync. A common problem with
s-video is that a TV is not terminated with 75 ohms. Just adding 75 ohm
resistors to ground makes all the difference in the world.

I only bought up the subject of computer house, because when I was working in the West End (behind regent Street) I used to contact CH alomst on a weekly basis as they had some great stuff there (h/w wise they were almost as good as silica shop,which was one of my regular Atari haunts)

I remember that they licenced some American product called turbo base and integrated prroducts, as well as the classic o/s controller card (I only have an xl version, my friend sid berry (ashford) had my xe version, b4 he got shot of it)

I also seem to remember they marketed modified xl and xe systems, I was also told that they had a version of the xe o/s that that the modified self test that memory tested the additional 64k xe mem (don't know if that was true), I remember Atari User and Page 6 saying that Atari were ready with the lauinch of this version... never saw it though (apart from the xegs)

You mentioned Northern Ireland, good, I remember from my days at London Atari Comp. Enthuasists (lace) that we had a member who lived in megarathfelt (NI) or something like that, also one of the founders of LACE also worked with computer house (he was their in house technical and repairs guy apparently) and prior to this he also once headed up Gladdin House which had a bit of a reputatation atari wise, by the way I live the other side of our great city (Islington) I was getting the sinking feeling that I was the only Atari fan this side of the M25 (south of watford), nice to know i've got company

Lol..

I used to live not too far from you, Dalston in Hackney (other end of
Essex Road)

Moved from there to Chiswick, then Clapham, then Ilford, then
Walthamstow and now back to Chiswick.

The best way is to build an external MyIDE interface and use a
CompactFlash to IDE converter with a 64 or 128MB card.

# 4079. eBay auctions: Atari 8-bit Monitor Socket to SCART or RCA cables

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-15 12:48:53 UTC
From: dgs@clara.net
Message-ID: <3568e886.0307150448.33421efa@posting.google.com>
Source record: 20392

Hello All,

Just a quick message to let you know that I currently have eBay auctions running for an Atari 800/XL/XE Monitor socket to SCART cable, and Monitor Socket to RCA Phono cable. These cables plug into the computer's monitor socket and deliver unmodulated composite video (and sound) to the TV either through the SCART socket, or RCA Phono sockets. This will improve the video/sound quality and will help if your computer's built-in TV modulator is no longer sending out a tunable signal.

The link is below (if it splits onto two lines, be sure to copy the whole link into your browser):

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=deangarraghty

Probably the closest thing to what you are talking about is being worked on (alas, not by me). Some type of a "super-duper" bank-switching cart should also be possible. The cart would host the Flash Memory device and load to the Atari from it. The flash memory would need to be removable and probably be "filled" on the PC.

Actuall, the flash memory can be loaded on the Atari if you use the newer (5 volt only) flash RAMs. Using a cartridge based interface is easier than SIO and much, much faster. As a cartridge, you can "take over" the Atari right after RESET and do just about anything you want. It isn't as easy on the SIO. With enough silicon, you can even run bank-switched carts that are loaded from Flash.

I am sick of ID10Ts on eBay. People trying to scam every cent off their vintage gear. I am glad there are still Atari dealers where I can spend decent money on quality gear at a fair price. One thing I hate is when people sell their crap for more than you can get it at the dealers! Especially with an opening bid! It's one thing to start the bid low and see where it ends...

Unbelievable!!!

Tim

Source record: 20306

There's only 45 minutes left and this system is at $355 and climbing.
I was going to bid $325 but it has climbed past my limit. I think it
is well worth it though. I have looked for a Corvus hard-drive
subsystem for a long time. You just don't see them, and the one here
looks tiptop with all the trimmings too.

I would not be surprised to see this system go much higher in the next
45, er... 41 minutes.

>
> Me? Ballblazer II (four player split screen). Ah.....

There was a Ballblazer - Remake called "Masterblazer" for the
AMIGA,ATARI ST and MS DOS PCs in the early 90s.

It had some extra gaming modes and used the "rescue on Fractalus"
fractal-routines in the intro.

But even this one is over 10 years old now and a new Ballblazer game
for modern consoles would be quite nice.

Also Remakes/Sequels to the other 3 Lucasfilm classic - Eidolon ,
koronis Rift and Rescue on Fractalus.

But LucasArts seems to make only Star Wars and Indy games today for
the mass amrket ... too bad , they once were one of the best companies
with their classic games and their great adventures ...

## 4095. A simple sort problem....

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-17 05:02:03 UTC
From: Mo <momo@atariland.com>
Message-ID: <f5qRa.91020$TJ.4962550@twister.austin.rr.com>
Source record: 20308

I'm having a little trouble with something that should be simple. (What's new?)
Anyway what I want to do in either assembly or basic is:
-create an array consisting of numbers 1-50
-generate random numbers and comparing against the array while keeping track of repeats (number of repeats for each number)
-then sort(rearrange) the array to reflect the numbers in order of number of repeats.
In other words I want to generate X number of random numbers 1-50 and then sort them highest number of repeats down to lowest number of repeats.
I hope that makes sense, I've tried it several different ways and get bogged down when it comes to sorting the array. Maybe someone here has done this type of sort before and can help.
Thanks,
Mo

Not in Australia...but www.jameco.com has two listed in their catalog. Try
the website...
41574cp...100ns...1.69
41582cp...120ns...1.39

both are limited. Check the pinouts to the schematic.

Basically...to run a bunch of DOS programs. Mostly text based. Spread sheets, data bases, and work processing.

When it crashes, so does CPM, so does the ATR, and then you have to start booting all over again.

Ultimately, from those that used it all for a while...the ATR is a great peripheral device, but otherwise, much better to play with A8 programs instead.

You can try soaking them in alcohol. That may make them work, but if they have been out, without caps for a while, the ink will be too thick to make work again.

I am assuming in BASIC that you have an array like the following:

DIM A(50)

You zero all the array elements, generate random numbers from
1 to 50 and add one to the appropriate array element.

To print out your sorted list, create a FOR loop that selects
the largest element of the array, print the element number and
value, and *zero* that element. Repeat until all elements are
zero...

FOR J = 1 TO 50
E = 0:N = 0
FOR I = 1 TO 50
IF A(I) > N THEN N = A(I):E = I
NEXT I
IF E <> 0 THEN PRINT "Element ";E;" is ";N:ELSE GOTO 100
A(E) = 0
NEXT J
100 PRINT "DONE!!!"

So lately, on www.AtariAge.com, I've been seeing news about some upcoming homebrew 5200 titles... ones that look and sound quite cool!
(Adventure 2, and a version of Klax, to be specific.)

Any idea if these would be easy to port to the Atari 8-bit line of computers (800, XL, XE)?

They're /practically/ identical, hardware-wise. :)

Seems like certainly that would be the case. Most all of the 5200 stuff was hacked to run on the 8bit computers, wasn't it?

Adventure 2 looks great, with great graphics. I wish the programmer would change the movement of the dragons though, so they don't just float through walls after you, but rather clomp and tramp after you obeying some physical laws. What he's done is beautify the fixed graphics but the player is still represented by a dot. It seems to me you could represent the player with an overhead view of a little guy or gal.

So I am really keen on this, but more so if the programmer would fix the movement of the dragons and replace the dot with a little adventurer. :)

FWIW, I agree, and thought it might go to $500+. I would love to have it, but that puppy takes a lot of space! I wonder what it cost NEW, and then translate that into 2003 dollars. Several thousand, I'd think.

That was the question I had and posted to the Klax announcment thread
on the AA board. Setting the sites only on the 5200 alienates European
Atari lovers.

I don't know about the other 5200 homebrewers but I know Ron is
interested in porting his works to the A8. I'm working with him in
porting Koffi to A8 for fun :)

Ignorance != idiocy

Not everybody knows about all Atari dealers. That doesn't make the person
who buys at the same or higher price than the dealer charges an idiot,
just ignorant -- and I don't mean that word in a pejorative sense; nobody
is omniscient, after all. There might be other factors, too, like trust
(or lack thereof) in the dealer, shipping policies (including
international shipping), etc.

Yes I do mean the other computer house (fulham) as I went to see them on several occ's (the first time I got lost, as I was trying to find landridge court, not landridge road... perhaps i should have taken one of their adverts with me)I think you took the No. 14 from the West End

Additionally, I used to work not far from dalston (rememberr the holywood video store in mare street (that's where I worked, near there) and also went to school near hackney downs (I didn't think to much of clapton), I havent lived in essex road since mum moved away, when I was still wearing nappies (diapers for you yanks) although I do go down there from time to time, I live in the part of Islington once called 'the little village'

Any idea if there are any atarifans around your neck of the woods

>;^)

What Bill is trying to say is that the dot (or more accurately, the flat little square) is actually the height of realism for this game. Nothing more need be simulated because that's exactly what adventurers of the time and place looked like. It's not known if these creatures are refugees from Abbott's Flatland, or if they are actually human beings walking around inside large acid-proof boxes (whose electromagnetic, metal walls protect against the ravages of a dragon's stomach, attract or repel items around them and remain perfectly aligned with the cardinal directions.) :)

All kidding aside, I find the old and new Adventure games much more visually appealing than some of the RPG efforts of the late eighties and early nineties. The later Ultima titles, for example, cram so much clutter and detail on the screen that the little two-frame, eight-by-eight animated sprites of Ultima 1 through 5 look very pleasing by comparison. There's also something to be said for modern video games that rely on graphics to convey information without any unnecessary flash or pomp (like the dancing platform arcade titles, or beautiful but frustrating Myst series.)

Wow, that's a lot of words to say that graphics don't matter. I'll quit now.

-KKC, who just bought a copy of Checkered Flag for no reason. It'll go nicely with my worn-out Tempest 2K cartridge and my unopened copy of White Men Can't Jump. :)

Just a small point but you have already given away enough info for people to
easily find out *exactly* where you live .... which may not be all that
clever in a public forum.
(coincidentally, I live in a road very close to you - the one thats
currently closed for roadworks).

Blimey, I had forgotten the address.

All I remember of John (Jon?) is that he rode a racer and had bad
exma(sp) so wore finger less gloves all the time.

He knew me tho :-)

Hehe, I lived in Grange court at the corner of Richmond Rd and
Queenbridge Rd (the Tower blocks). I'd pop down the waste on Kingsland
rd every sat. I'd get the bus to school from the 30 bus stop at the
Dalston end of Graham Road.

>Any idea if there are any atarifans around your neck of the woods

Not that I know of to be honest..

I had the same thought (ie., "Sequels are better? Who says?").
Then I thought of a case in point.

Think of Ultima I.
I would say Ultima II was an improvement.
I would also say Ultima III was an improvement over II.
Since III was the last Ultima game I played, I'll stop there.

Anyone have examples on either side of the postulate?

Rob

What is a sequel - a follow-up that wasn't planned when the first one
was made? I don't know if Namco (?) knew they were going to introduce
the whole Pac-Man family (Ms, Jr, Grandpa?) when they made the first
game. If it wasn't planned on beforehand, I'd call Ms Pac-Man a sequel.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> or gal.

Yes he could but there was a debate early in the development of this
about how to represent the main player. The "dot" won over any other
character. The vote results used to be on his site :(

Take care,
Dennis

I never would have thought of that, but it sounds great. I would
also think that Rescue on Fractalus would need a sequel.

Lessee...

On the Inty, I really liked:
Thunder Castle
SNAFU
Shark! Shark!

Arcade ... hmmm.. I really did like Gyruss a lot, too. I don't recall any other ones off the top of my head that really hit me, tho.

I've never heard of that one, must be rare! I wonder what would be the most
coveted cart for the 400/800. I've heard that tooth invaders is the holy ark
for the 2600 because it was a promotional giveaway that didn't have a very
long run. I wonder what the 8bit equivelant would be?

There's a Ballblazer for the PlayStation. It's, of course, all polygonal
3D, and has more varied terrain.

It's neat, but doesn't seem to hold up to the classic, in my opinion.

Hmm this all sounds very interesting could we make a mailing-list of people
that get these systems by donation.
We could publish a list of what people have and maybe can exhange them. Like
I know the Atari 810 drive is very common in the US but not so in Europe and
Czech. In Czech the turbo-2000 XC12 cassette is very common but not in
Europe and the US....

Just a small list and people contact each other by e-mail. I think the items
being exchanged must NOT be sold the only money that could be asked is for
the shipping-cost to someone else...

Let me know who is interested. We can setup a list.

Source record: 20262

I'll be selling (for cheap), the following equipment, as a set, at an upcoming
swap meet that my Linux Users' Group is holding :^)

* Atari 800
* Four joysticks
* Atari 1050 disk drive
* Commodore Amiga montior
* ... all the cables and power supplies to get them all connected

Plus, some games:

Cartridge:
Pac-Man
Centipede
Missile Command
Basketball
Star Raiders
Atari Writer
Music Composer
Monkey Wrench

Disk:
Zork I
Solo Flight
Frogger
Zaxxon
Flip and Flop
Lode Runner
Jump Man
Summer Games
Caverns of Mars

All tested and working! I'm not sure how much I'm going to sell it all for,
since a LOT of it I got for free. OTOH, I'm broke and unemployed, AND part of the
proceeds from this 'geek swap' will benefit my LUG. :^)

So, if you're in the area, or feel like coming out this way on August 2nd,
it'll be there (maybe even hooked up and playing games ;^) )

http://www.lugod.org/projects/geekswap/

And who knows what other bizarre hardware will be there!!?

Message-ID: <3f1a08fd$0$4010$2c56edd9@news.cablerocket.com>
Source record: 20264

I have this really neat Disk Emulator package from BL Enterprises that does not work. It came with a SIO cable that seems identical to a standard Atari cable, which seems odd - you would expect that data-in and data-out would have to be swapped..... Anyway, does anyone know anything about this device? Any chance that source code is available? We have a lot of PC-based data servers, I want to do an Atari version. If I don't have to run ANTIC, an Atari will do great with floppies, CF cards, hard drives, PC formatted disks, and all kinds of stuff.

Anyone know the guys that made this thing?

Bob

Nope I don't know them.
If I am remembering correctly there was an article in ANTIC or ANALOG
describing a cartridge which turned a second Atari into a disk
emulator/Printer spooler. There was even a picture I think.

Maybe someone can tell which magazine nr. it was. Maybe when you're lucky
there is an address.

But I am not sure if it's this item or somewhat similar.

Gerhard Pirker <digriz@gmx.net> wrote:

> Recently I got a very old Atari 800XL.
> Unfortunately I encountered the following problem:
> After turning it on, there comes something like a merory-test on the screen.
> Then it reads RAM and there come a lot of green and red squares.

Thank you guys for all your information!
Last weekend I found some time to try out your suggestions.

I opened the machine and checked if the RAMs get hot after turning it on.
But (un)fortunately the RAMs remain completely cold.
Instead, one of the two ICs called '8327' gets very hot very quickly after
turning on, the other '8327' remains cold.
The other big ICs get warm after some minutes, but just a little...

What job does the left '8327' and can this be the reason for the memory-test
after turning on the machine?
Do you think it makes sense to get some other 8327 for replacement?

Btw: I did not connect the floppy drive, so there cannot come any influence
from that.

Best regards,
gerhard.

I don't know the 220v supply, but the 850 uses a 9v
ac power supply, the same as for many of the 8-bit
accessories, eg. the 1050 disk drive, 1010 tape,
the 800, the 1200xl. 9vac maybe 3 amps.

Message-ID: <bdmlhv0qqikgu3ar17idogrrt2fgbvgqd2@4ax.com>
Source record: 20273

This is actually the second time I installed these (new system) but I really find the songs a lot of fun and even good music in some cases so I wanted to tell you all how to do what I have done.

I downloaded and installed free stuff to play a free collection of 1647 SAP (Slight Atari Player) music pieces. You need a Win95 or Win98 PC, or possibly later Windows systems are okay too. You must have working sound and hopefully good speakers. If you have those things here's how you do it:

1) Go to http://www.oldversion.com and download WinAmp 2.80. Install.

2) Go to http://mp3.musichall.cz/Unreal/ASMA/ and download "SAP Winamp Plug-in v. 2.2." This page is in Polish, so just look for the link. Install the plugin.

3) At the same page, download "Atari SAP Music Archive v. 2.6." You probably want the ZIPped version. UNZIP this archive to it's own folder.

Okay, from here you should be able to click on a SAP song, associate the filetype to WinAmp and it should play. You have about 200 hours of listening to do to get through each of those 1647 songs, but it is well worth trying because as I said many of these are very good. One of my favorites right now is "Debilizator."

Let us know if you like the songs!

I believe 8237 is the date code and not the part number. Can you supply another number from the chip like ( CO12498 or SN74138) or the IC location on the board like(U22 or U6)?? If so, I can be of more help. Paul

Fair point,not that I've got much to nick, funny thing happened a week or so ago, my push bike which was padlocked to railings in our garden, someone or something decided to help themselves to my bike by hacking of the chain,now this made me laugh because, whoever helped themselves to my bike will have to spend a lot more to get the bike upto reasonable use, then it will cost them to by a decent second hand bike, as my bike needed several repairs/replcements done

Anyway getting away form that, and back to things atari, do you know anyone that has a prototype of the computerhouse (fulham) floppy board (forget the derek firn/microdiscount jobbie, that was just a hacked version of atari's xf551 jobbie) or a original released version, also I would be interested in seeing one of the modified xe's that computerhouse were exclusively selling (was it true that computerhouse had a version of the xe's o/s that allowed the self test to test the full 128k ram (xe only) and I'm not referring to the xegs o/s, which had this patched code included, I remember that Atari were going to launch this version into EU markets, but I'm reliably told they never got arround to it... typical ATARI)

until then, yours Atarily

Carmel A

You must be referring to the 74LS158s in the memory circuit. These chips multiplex the memory addresses and could very well be your problem. Of course, the 8327 is a date code.... these could be two completely different chips! Look for something like 74LSxxx or some such.

I seem to recall it required software on the "drive" Atari. Back when I
maintained (and eriodically posted) the strange hardware faq, there was
this entry:

Zucchini
In ANL 59,60 and 62, Dr. Lee S. Brilliant provided plans and software to
turn a surplus Atari into a printer buffer for another Atari. He called it
"The Atari Zucchini".

The Printer Buffer Routine (PBR) and Disk Emulator Routine (DER) came from
B.L. Enterprises. They were cartridges and cables which worked in a similar
fashion to the Zucchini. The PBR provided a buffer, while the DER emulated
a disk drive on the remote computer. Stock XLs gave 403 free sectors; a
130xe would give 914. (ANL 65, 67)

-=-=-

The Zucchini articles included the source. If you've got the DER cart, can
you crack it open, dump the ROMs and disassemble? Not as good as clean
original source, but a start just the same.

# 4166. CP/M disk for ATR-8000

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-21 06:24:50 UTC
From: James Alexander <james-m-alexander@rogers.com>
Message-ID: <3F1B8724.59486CF4@rogers.com>
Source record: 20279

Hi everyone,

Some time ago I was looking for the CP/M disk for my ATR8000. Someone, I forgot who (ooops) emailed it to me but I lost it in a crash before I got it transfered to my 8bit. Does anyone have this they could email? or know where I could find it? I'm really wanting to get my ATR back into operation again. Also I'm looking for the serial and printer cables that could be connected to the ATR8000. I could easily make these up myself but have a very hard time finding the connectors for the edge connectors on the ATR

On a side note I got my ATR at a user group meeting back in the early 90's with an atari 800 and an old 5 inch green monochrom electrohome monitor. The system I got plus 2 others (one of the ATR's had the co power 88 msdos option) had been used in a warehouse of Irwin toys which had been the Atari distributor in Canada in the early 80's. The 3 machines (plus another broken down 800) had been in use in the warehouse since then until the early '90's and were in quite dirty condtion but still working (mostly).

You are absolutely correct, this is the date code. ;-)
Sorry bout that fault...
The number on the chip reads C014806-12 and 11151-12
and on the board there is written U8.

regards,
gerhard.

I don't know French, but I think the above would be the work known in
English as "Pictures at an Exhibition".

Which movement, however? There are several, of widely-different
characters, many of which would make great in-game music (I have _Hut
of Baba Yaga_ in mind for a possible remake)...

Somebody probably already said.
the U8 CO14806 is the 6502C CPU chip, 2nd
LSI from right at the 'bottom' 4 LSIs.
I don't know if it should get hot.
The 11151, I dunno.
Sometimes, you can fix a A8 by swapping out
known good chips, ie. you need a 2nd working
800XL and for the major chips to be socketed.
I also muck with a logic probe, comparing the
bad computer with the good board.
The 4 LSI chips at the bottom of the board are
GTIA, U17, (left), U7 Antic, U8 6502C, U23 PIA.

I'll take a look in the Analogs - thanks! I can dis-assemble the ROM from in the cartridge (with OmniMon), but I'll be an old, old man by the time I get to the bits and bytes of how the cable is wired.

(funny, the code writes to the cartridge - I may have to open it up after all)

Thanks again...

Bob

Well, I'll be more than happy to adopt any poor, unfortunate, homeless A8 units in California's Central Valley and Central Coast areas if need be... ;-)

# 4176. FS: boxes of hardware

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-22 04:27:28 UTC
From: kheller2@mac.com
Message-ID: <6982911f.0307212027.4af887b7@posting.google.com>
Source record: 20289

I'm an old time collector (well, not that old I guess) of Atari 8 bit gear. I have owned some of the very rare proto types and I still keep a 1450XL board around. However, to the point of this post... I have a bunch of stuff. Yes, stuff I need to clear out at whatever fair price I can get plus s/h. I don't have a complete list as was amassing it much to quickly. As I dig through the boxes I'll post more if people are interested.

What did you miss? Well, I actually threw away boxes of spare part boards... 810 boards, side boards, 800 parts, 1200XL mother boards, 130XL mother boards etc... none were in 100% condition but they were taking up space. I cried.

Here is what I know I have sitting in the basement.

Several 800s.
Several 800XLs.. not all complete, some are yellowed, although I do have a few complete units.
1050s
Indus GT drives (some even with those big plastic cases they used to come in)
1 Rana Systems drive
two broken but salvageable ICD MIOs. The ram on them are gone AFAIK.
Many 850 interfaces
Many ICD PR Connections
Atari touch tablet

Two 1040STs (wrong news group, I know)

Also have 5200 parts
Very good condition 5200 trackballs
Several personally refurbished 2600 units of all different types (I used to do the 2600-7800 FAQ years ago.. and the first Jaguar FTP site)

I'm sure I have more..

I have probably 5 1020 printers in various conditions.. some are mint but with broken gears, others have shattered covers but working components. (I purchased about 9 of them several years ago... the seller didn't pack them at all and were free to roam around the UPS box).

I have stacks of Analog and Antic magazines.. including some very early editions.

I'm hoping to maybe get $10 a component or stack of components. I'll part things out for people if they wish, or you can just purchase the boxes of stuff and see what you get.

Email me at kheller2@mac.com if you are interested. I'm located in Central East PA.

# 4178. A very stupid question about printing to the screen...

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-22 11:34:30 UTC
From: Undead Mechanic <davidb81@earthlink.net>
Message-ID: <aj9Ta.114383$lo.9776092@newsread2.prod.itd.earthlink.net>
Source record: 20291

Ok, so I'm a blatant moron, but I hope by asking this question here I can solve this problem.

Here is my problem...

I have been writing assembly/ML routines for ages and have always gotten the job done. Well, one thing I have never figured out is how to print to the screen by doing a JSR $F6A4 with the ATASCII value of the character I want to print in the accumulator. No matter what I ever tried, I would always get the dreaded "ERROR 141", or it'd print one blank space on eash row, advance to the next row, repeat, and eventually lead up to an error 141. So, having been hung up by this problem, I simply opted to create a table of crap to convert from ATASCII to the ICODE values and vice versa and stuff the internal code values directly into the screen memory via SAVMSC (88,89/$58,$59) whenever I needed to print something.

It's gotten to be such a headache for me that I almost gave up entirely on printing from ML, not to mention that the table takes up otherwise useable memory plus the routines to convert from one set of code to the other. So, please, does anyone here know what I've been doing wrong all this time, or can you at least give me a pointer or two on something I can try?

Any help on this is greatly appreciated.

> job done. Well, one thing I have never figured out is how to print to the
> screen by doing a JSR $F6A4 with the ATASCII value of the character I want
> to print in the accumulator.

Arghl! You don't! Never ever(!) jump to absolute ROM addresses. For printing,
you need the CIO routine at $e456, and the E: handler that prints data.
The system opens IOCB #0 to this handler, allowing you to print data directly
to it. Here's a (hopefully correct) printing routine that writes the character
in A to the screen using the recommended print handler:

```
PutChar:
pha ;keep A on stack
ldx #$00 ;we`re using IOCB #0 as this is open for E: by default
txa ;clear A
stx $348,x ;zero the length
stx $349,x ;ditto
lda #$b ;put characters
sta $342,x ;set the IOCB command to "put"
pla
jsr $e456 ;call CIO
rts ;done with it
```

Alternatively, you can print a complete string at once by placing its
address in $344,$345 and its length to $348,$349, then call CIO with a
command $b as above. This will be quite a lot faster than writing it
character by character.

Note well: The Os is your friend. (-;

Greetings,
Thomas

Well, the response to this post has been pretty good so far. I haven't had time to write back to everyone yet... yet.

I've come accross a few other things. All things are sold as is, no warranty implied, and prices do not include shipping charges.

Working when stored years ago:

XDM121 Printer $20 (comes with oringal red box.. box is crushed however)
XMM801 printer $20
New in Box Book Keeper Kit (Keypad + software) $10
1027 printer $10
MPP 1150 Printer interface w/manual. $5
2 x Koala Touch Tablet
2 x Atari Touch Tablet
810 Floppy drive with flip door
810 Floppy drive with slide door
XMM301 Modem
1030 Modem
XE-GS Consoles (Main unit + keyboard, no light gun, sticks or software), yellowed: $10, semi clean original color: $15.

May work (probably does):

1025 Printer $10
825 Printer (I don't know if I have all the parts for this thing.. there were many metal rod contraptions for this) $7
822 Printer $7

Power supplies... I will attempt to locate all power supplies for above units. I have most of them... although I'm short on some. I will let you know if I have the supply when you show an interest.

I prefer to only ship to the USA. Payment can be personal check (will need to clear bank) or Post Office Money order which is prefered. You can always send cash via certified letter if you are very lazy. =)

I don't have any Atari reference manuals here, so I can't check, but this looks
a bit strange to me... Is it true that if the length of the CIO buffer is 0, it
just uses one character from the A register? Isn't there a different CIO
command to put just one character?

Does anyone know something about the Phoenix-Web-Browser Project for
ATARI-8-Bit?
The Homepage of Phoenix hasn't been updated since February 1999. So it seems
not to be an april-joke.

A length of zero will output the character in the accumulator.
Note also that all registers values will be destroyed by this routine.

Well, that makes a lot more sense. I havn't tried it yet (but I'm about to).
What led me down that little nightmarish road was an Article from 1981 in
"Compute's First Book of Atari" by Larry Isaacs. He goes into detail on how
this routine works, but the prog crashes every Atari I ever tried to run it
on. I looked up the address (F6A4) in several different maps, and they say
that the routine was never moved from day one, but I never could get it to
do squat besides run the cursor out of range...

> >

Source record: 20201

uuhhhhh..... $F6A4 in the XL OS seems to be in the middle of nowhere. You really can't use a fixed address like that very well - you need to use the vector at $346,7. Add one to whatever address you find in there and use that to print the accumulator to the screen. If the printer at $3B6,7 is open, you can use that address (+1) to send a character to the printer also.

In a stock 800XL, the put-byte address is $F2AF (add 1 to get $F2B0). $F6A4 is OK for the 800....

OK?

Bob

> OK?

Almost. (-; I would not recommend the PutOneByte vector. Handlers should
support it, but that's typically causing headaches for the handler itself
as it cannot tell just from the command whether "bursting" would be fine.

Thus, you might end up slower than just using CIO to transmit a full block
of data at once.

Greetings,
Thomas

# 4197. New WriteAtr with experimental enhanced density support

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-24 14:49:46 UTC
From: Matthias Reichl <usenet-20030724@hias.horus.com>
Message-ID: <slrnbhvsga.1l3.usenet-20030724@camel.hias.horus.com>
Source record: 20210

I've uploaded a new version of WriteAtr (V0.92b) to my homepage

http://www.horus.com/~hias/atari/

This version contains experimental support for the enhanced density
(1040 sectors in MFM) format.

Although most of my datasheets about uPD765 compatible floppy
controllers contain a note that this format (128 bytes per sector
in MFM) doesn't work, some experiments showed that my PC
(350MHz P-II, ASUS P2B mainboard) is able to create this format,
but it cannot read the disk it just wrote :-) But then - my
stock 1050 happily read from and wrote to the disk!

So feel free to try it with your PC. I can't guarantee it will
work at all for you so use it at your own risk!

BTW: for those of you who don't like to read manuals, here are
the command line parameters to use the enhanced density format:

writeatr -f9 -n my.atr

so long,

Hias

# 4198. Re: A very stupid question about printing to the screen...

Newsgroup: comp.sys.atari.8bit

From: Wilheim <guillermo@mail.cl>
Message-ID: <bfp0r7$ou6$1@news1.nivel5.cl>
Source record: 20211

```
Reading all the the replies of this topic, I realized to make the following
routine:

*=$4000

aux=$cb
hatabs=$31a

; let's find the putchar routine.

prepare.putchar
ldx #$00
loop.prep.putchar
lda hatabs,x
cmp #'E
beq endloop.prep.putchar
inx
inx
inx
bne loop.prep.putchar
endloop.prep.putchar
lda hatabs+1,x
sta aux
lda hatabs+2,x
sta aux+1

; now we'll get the putchar routine

ldy #$06 ; go to put routine
lda (aux),y
sta putchar1+1
iny
lda (aux),y
sta putchar2+1

; ATENTION: I'm not sure if the order is right. If it doesn't work, please
reorder the STAs.

rts

putchar
tax
putchar1
lda #$FF
pha
putchar2
lda #$FF
```

```
pha
txa
rts

With this routine, I think you can put a character stored in the accumulator
on the screen.
Any comments?

Wilheim
```

# 4199. eBay auctions: Atari Monitor socket to SCART and RCA Phono cables

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-24 21:45:19 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1059083262.45416.0@demeter.uk.clara.net>
Source record: 20212

Hello All,

I have auctions not far off closing for an Atari 800/XL/XE Monitor Port to SCART cable and an Atari 800/XL/XE Monitor Port to RCA Phono cable. These are suitable for PAL or NTSC systems (but NOT SECAM). They are useful if your TV output has become noisy. These cables use unmodulated composite signals to carry the picture and sound to the TV and give a far superior image to the RF (TV) cable.

II also have some software for auction, including the Atari Unusual DOS Pack, which includes Atari DOS 1,3,4, and XE.

The link is below (this will split on to two lines, so please copy both lines into your browser):

http://cgi6.ebay.co.uk/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=deangar
raghty

Also, does anyone want a monitor port to S-Video cable (C/Y)? I'm thinking of producing those too soon. These can be Monitor port to 4-pin mini-DIN S-Video plug + RCA Phono for Audio, or monitor port to TYPE 2 SCART (type 2 SCART has Y/C but no RGB). Type 2 is found on TV sets with more than one SCART socket, and is usually socket 2 (or 3 if you have a really expensive TV!). If anyone would be interested, let me know by e-mail. Give me an indication of what sort of cable length you would prefer. e-mail: dgs@clara.net

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Yes. Please don't do it like this. It's the job of CIO to look for the
handler and call the handler.

```
Not necesarilly. The HATABS is standard by Atari and you can use it , for
example, when you want to create a handler or modify an existing one. In
this case, we are getting the information of where is the putchar routine.
So, instead making programs like

lda #'A
jsr $f6a4 (OS-A) or jsr $f2b0 (OS-B) or whatever

you can make it by

lda #'A
jsr putchar

That's my idea, to preserve the format used. I think it's more portable to
the different roms.
```

You can get them on the net, most are freeware too. 20+ year old software is anyways. Problem is you will need to convert ATR image to 5.25" disk. I can convert to disk using my Amiga.

Tim

## 4207. Yet another ATARI adoption agency

Newsgroup: comp.sys.atari.8bit

Source record: 20220

I see that two other people have posted, with similar
topics, so if anyone would like to donate ATARI 8-bit (possibly
other old systems, too) I'll take them. Located in the
Missouri/St. Louis region, will pick up within a (roughly)
100 mile radius. Will pay for shipping on SOME items. zip code 63357

Contact little_goblinman@yahoo.com

-Andrew

That's technically incorrect. Copyrights exist for much longer than 20
years, however, the copyright holders may not care about 20+ year old
software enough to threaten legal action.

and yes, I do have a vast store of old, illegally copied software.

## 4211. Name that mystery game...

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-26 07:49:32 UTC
From: nickb@io.com
Message-ID: <jm6dnXZZn4ERr7-iXTWJiA@io.com>
Source record: 20224

I remember vaguely an Atari 8-bit game from my childhood. I got it off
a BBS somewhere.

It was 138 SD sectors long. I think. I know XAGON's about that size too,
so I hope I'm not imagining that.

It was a multi-screen platformer, probably similar to Starquake, and it
had something to do with dragons, maybe in the title.

For me, it was on a disk with a green happy face sticker for a label,
but that probably doesn't help any of you.

That's all I remember.

Can anyone please help me identify this game?

> www.atarixle.de

Greetings Mirko,

I never was able to get past the planning stage of the project. My notes for the project are all filed away and have been for a few years. Tripod told me that they were going to remove the page a couple years ago, but it looks pretty much active still. In any case, I've been out of the Atari scene for at least a year and a half, and still have three good-sized boxes of Atari books and documentation that I can't bring to throw out, neither do I want to bother with EBay anymore--so it sits here. If anyone reading this is interested in taking it off my hands, they can reach me nowadays at morloc@morloc.com

However, everything must go as a package. I don't want to be left with anything that I'm never going to use. If someone else wants to part it out after that, that's fine by me. But I've held onto the information this long, and when I get tired of it, I'll eventually trash it out. I have too much to list here, ranging from Assembly Language programming, Mapping the Atari, books, manuals, photocopies, everything I could grab from EBay back in the day... Make me an offer, if interested, that will at least help me recoup some of what I've invested, and to cover shipping (unless you want to pick it up and are in Mid-Michigan), and we'll take it from there...

As for the Web Browser project, it was intended to operate similar to Lynx (for the PC), and I had acquired written permission from the dev for the C64 tcp/ip handler to include in the project. But, like I said, I never got past the planning stages and how it would operate in a 128K machine (with plans for a stripped-down version for the 64K stocks) and how it would have taken advantage of additional RAM available.

Regards,
Timothy

At 15 frames per second and 4K per frame, you need 60KB per second - much too fast for any HD on an Atari. Using the HDD to load a 16MB DRAM would work. Using ANTIC memory banking to flip screens, you could get something like 4 minutes of FMV.... with almost *no* CPU overhead.

Well, CIO is the most portable, and actually the only "user entry" that
should be considered for handler I/O. (-: For example, on the XL system,
HATABS is not the only source for handlers, CIO also manages a chain of
additional handlers that could have entered the system by means of the
PBI, e.g.

Besides, if you call thru HATABS, you bypass a couple of sanity checks
CIO performs, and you eventually break "burst access" by the handler.
Thus, you could even have *slower* IO than call thru CIO directly.

So long,
Thomas

Theres a few I could come up with, like:
Space Invaders (the Roklan version).
Wargames
Rampage
Battlezone
Raid over Moscow
F15 STrike Eagle
Racing Destruction set

Games I've seen on other 8bits I wished for on the 8bit
Slot Car Construction Set (from Activision)
Berzerk (yeah I know it was prototyped but never relased)
Paradroid (forgot who did this one)
Franzy (yes the berzerk sequel)

Might it be Draconis? I remember this fits the description above, platform
game with dragon like character as the player. I remember it being quite
popular on the bbs scene and among more than a few user group libraries.

# 4222. Fun with atari two player simultane

Ya know, if these "people" like the idiot I am pointing out in my example would just stop posting, then the world of computers would be so much better off. It's obvious that there's a hidden begger (see post example) trying to obtain these and won't even have the guts just to ask.

How pathetic.

This idiot wrote; On 2 May 2002 20:25:09

The Contiki web browser works with both the C64 and Atari 800XL. From what
I understand, it works well on both machines, has the ability to TCP/IP,
and allows limited web browsing (no pictures as of yet).

Hi,

I've been away for awhile and was wondering if there was any news on
the Win32 port of Atari++. Also Is Atari800win PLus dead?

Regards,

Michael

## 4233. Commodore One

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-28 00:53:00 UTC
From: bill@newbreedsoftware.com
Message-ID: <Mt_Ua.5822$dk4.272661@typhoon.sonic.net>
Source record: 20246

I went to Amiwest 2003, the Amiga computer show that took place in Sacramento this weekend, and met Jeri Ellsworth, creator of the CommodoreOne (C-One) board [ http://www.c64upgra.de/c-one ].

She said she's looking into getting the FPGA programmed to emulate the Atari 8-bit system. I encouraged her to pop in comp.sys.atari.8bit, but she said comp.* groups have been too full of trolls, and asked about whether any good IRC channels exist. :) (I see someone recently asked that here, so I won't bother asking again ;) )

Anyway, unfortunately, noone had a _working_ C-One at the show, but I just stumbled upon a little review of it from AmiWest 2002:

http://www.portcommodore.com/amiwest/

And here's a little press release about its appearance at this year's AmiWest:

http://www.sacc.org/amiwest/press03-9.html

Anyway... I fully encourage this kind of development. ;) I _adore_ emulators ("Atari800" rocks my world), but I think this a very cool way to keep the /soul/ of our 8-bit systems alive. :) Sometimes it's nice to have something to hook up to your TV set...

I do have to apologize for not having any news the last few months. My work has kept me quite busy over the last few months, but I'm starting to see the light at the end of the tunnel! Anyway, I haven't forgotten you guys, and I do intend to continue the porting work as soon as possible.

I still have all the people who offered to help beta test, and I hope to be getting in contact with you guys (as well as you, Thomas :) ) soon. Feel free to start nagging - I deserve it!

# 4238. Re: New WriteAtr with experimental enhanced density support

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-28 10:16:55 UTC
From: Matthias Reichl <usenet-20030728@hias.horus.com>
Message-ID: <slrnbi9u0n.19r.usenet-20030728@camel.hias.horus.com>
Source record: 20151

On Thu, 24 Jul 2003 16:49:46 +0200, Matthias Reichl wrote:
> Although most of my datasheets about uPD765 compatible floppy
> controllers contain a note that this format (128 bytes per sector
> in MFM) doesn't work, some experiments showed that my PC
> (350MHz P-II, ASUS P2B mainboard) is able to create this format,
> but it cannot read the disk it just wrote :-)

I've made some additional tests on two other PCs: A 486/66 with a
Vesa Local Bus IO controller equipped with a Winbond 83757AF FDC,
and a P-233/MMX with an Asus P5A-B mainboard:

The 486 could neither read nor write enhanced density, but
the P-233 could _both_ read _and_ write it!

So, if you test the ED functionality of WriteAtr with your PC,
please drop me a line if you had success so I can build a list
of working IO-controllers/FDCs/Mainboards. If possible, email
me the exact type of IO-controller or FDC used on your
mainboard, I suspect that the ED capability is only present
in certain revisions of IO controllers.

BTW: If you test the read-functionality, please compare the
ATR you just read with the original ATR you wrote to disk - I
once had the problem that the FDC reported "OK" on read, but
returned (partially) garbage...

so long,

Hias

Greetings,

If you are referring to the Phoenix Project being a "hoax," you are
basing your "opinion" simply on the basis that I never finished it?
That's laughable. And, no, it would not have worked at 300/1200 baud.
Actually, the initial design was for use with a MIO or black box,
which had the capacity to utilize faster modems. At the time that I
was developing it, 2400 baud modems could still be used to connect to
some ISPs (although very few). But I agree that anything under that
would not have worked--not because of the web browser itself, but

because of the inability to find an ISP which would allow connections
at those speeds.

I'll just 'Rambo' his ass if he starts ;-)

Hold on, there's me and him starting WWIII so no one is going to send
us their old Atari's to adopt.

That means they will send them to you

You sneaky sod....You set this up ;-)

# 4243. Atari++ and Debian (Report and Questions)

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-28 19:46:21 UTC
From: Thomas Havemeister <twh1@gmx.de>
Message-ID: <pan.2003.07.28.21.46.20.696353.9604@gmx.de>
Source record: 20156

Howdy *.*!

I finally ran away from Redmond and found my new home with Debian :-) .. however, I need of course an xl/xe emulation on my pc. so I heard many good things about Atari++ and today I installed it.

I was very impressed by the easy installation (don't forget to install the sdl and sdl-dev!!) and the single executable file in which the compilation resulted. Well, I dont remember an emualtion which is so compact :-)

I had some trouble in "feeling good" with the new frontend which is different to the atari800winPLus emulator, but after a while it was just as easy to use as the windows thing.

But I have also problems with it (thomas please don't be pissed off, this is only a report)

*the fullscreen support using sdl seems to work, but instead of a fullscreen atari blue I got a big black border and a very small atari viewport. What the hell?!! When changing the pixel-size, the performance decreases dramatically. So why not changing the resolution?

*where is the keyboard-shortcut descritpion? (where is the Atari-Key?)

*the compatibility seems to be a problem in my version. There are a lot of demos, which simply did not work properly. In my short testing time I tried Trip6 for example which crashed the emulation.

*the performance is also not the same as with Atari800Win .. at least my old PIII 500 has many problems with Drunken Chessboard, which runs perfectly but slows down when the vertex's are rotating or the chessboard is moving. Why? Is it because of the exact emulation?

*the pokey sound is much better than with Atari800Win ... at least I think so :-) ... the sounds are more "smooth" ... but as normal (this seems to be a general problem to all 8bit emualtions I know) there are some "clicks" and annoying "pop"-sounds when leaving or entering the menu or while loosing/getting the focus of the window

*as for the compatibility again: Our5oft's Demo (disk 16 in the Homesoft archive) shows to the left the hires gr.8 mode in the middle the gr.9 mode (or gtia mode) and to the right only garbage. Maybe, the emulation is precise enough?

I'm looking for a basic detokenizer. Years ago, there was one written by '-=Psycho=-' and was wondering if anybody had it or any other detokenizer laying around that they could post to alt.binaries.atari or post somewhere -- or point me in the right direction.

Thanks.

Is your X display able to switch resolutions? (e.g., if you hit CTRL+ALT+Numpad-Plus or +Numpad-Minus, does the resolution change?)

If not, this is the problem. When SDL is told to go into fullscreen mode, it doesn't do any software resizing for you, it simply tries to switch the display to the closest resolution that will fit the window. If it can't switch displays at ALL, you're left with just a big black border.

Run "dpkg-reconfigure xserver-xfree86" (or whatever the exact package is you use for your X server), and, assuming you agreed to let it be configured by debconf, you should get asked questions about your monitor, video card, etc... like when you first installed Debian.

At this point, you should be able to tell Debian what resolutions you want X to be able to switch to. If your monitor and X server can handle it, and it's an option, go for 320x240! :^) :^) Otherwise, you might be stuck with only being able to drop down to 640x480. There'll still be a border, unless you crank the emulator up to double-pixels (which, as you mention, is slower). But it's still better than trying to stretch a little ~320x~240 window out to 1280x1024, or living with tunnel vision ;)

Not to start a flamewar, but since you have some many problems which sound like they worked under Atari800Win, have you considered just trying Atari800 for Linux? *shrug*

Hello,

for all those who might be interested in rare Atari 8-Bit software and
games please take a look at my games currently at ebay.

For example, factory sealed Mario Bros.:

http://cgi.ebay.de/ws/eBayISAPI.dll?ViewItem&item=2744388437

I ship worldwide and I accept PayPal payments.

Thanks for your attention,

Andre

## 4250. For what do you use Emulators?

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-28 22:29:36 UTC
From: Mirko Sobe <atarixle@12move.de>
Message-ID: <bg484g$1cef$1@ulysses.news.tiscali.de>
Source record: 20163

I want to know, for what are people using ATARI-Emulators?
I use an emulator to test configurations I don't have in real (R-Time-Clock, dual-pokey, DOSses I don't want to install on my HDD) and sometimes I need more speed. I often use an emulator on my Laptop to have a mobile ATARI-8-Bit-System. But usualy I use my real ATARI 800XL (320kB, HDD).
What do you do with emulators? Do you own a real ATARI?

Mirko Sobe

# 4251. FA : Boxed/new XL/XE cartridge games

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-28 23:08:15 UTC
From: Ulrich_Sternaxe@gmx.de
Message-ID: <f16cbc23.0307281508.6fc913e5@posting.google.com>
Source record: 20164

Look at :

http://cgi6.ebay.com/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=klassische-videospiele&sort=3&page=1&rows=25&since=-1&showpics=1&stab=0

Everything is "buy it now" and the prices are really low for boxed,new + sealed games , this may be the last chance to get factory-sealed ATARI XEGS carts.

I have for example :

XEGS carts (48K req. , some 64K only)

Airball - classic 3D isometric action-adventure -64K only
Thunderfox - great space - shooter with superb music and graphics
Lode Runner- classic by Broderbund
Ballblazer - classic game by Lucsfilm Games
Rescue on Fractalus - classic game by Lucasfilm Games
Archon - classic game by Electronic Arts
One on One - classic Basketball game by EA
Davidï¿½s Midnight Magic - pinball game by Broderbund
Star Raiders 2 - classic game by ATARI
Crossbow - Lightgun - action-game
Crime Buster - another Lightgun - game
GATO - submarine simulation
Hardball - classic Baseball game
Ace of Aces- flight-simulation

XL carts (usually 16K required):

Pole Position - Racing game
Moon Patrol - classic arcade game
Robotron 2084 - classic arcade game
Joust - classic arcade game
Tennis - ATARI Tennis for 1-2 players
Millipede - classic arcade game
Eastern Front - strategy game
Final Legacy - action-game

All the games are BOXED , new , factory-sealed , in great shape.

I can ship worldwide and will accept PAYPAL.Itï¿½s possible to combine shipping.

I may also sell games without ebay , so if an auction has ended ,you may still ask if the game is still available.

I may also sell to traders.

I also offer lots of boxed/new ATARI 2600 games.

MG

# 4252. FS : Many boxed/new ATARI XL/XE cartridges

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-28 23:11:27 UTC
From: Ulrich_Sternaxe@gmx.de
Message-ID: <f16cbc23.0307281511.5124fc48@posting.google.com>
Source record: 20165

Hi,

I offer the following ATARI XL/XE cartridge games by ATARI.

All the games are boxed and new , still factory-sealed in original shrinkwrap.

The games are US/English versions , they work on NTSC and PAL systems - there are no PAL-NTSC differences as known on the ATARI 2600.

I can ship worldwide.Shipping is about $14 for up to 15 , maybe 16 or 17 games (depends on the weight) or $7 (surface mail) / $9 (Air Mail) for only 1 game.

I can accept PAYPAL.Cash for very small orders or money orders/checks for bigger orders (because of bank fees).

Please note : The XL games in silver boxes - Millipede/Robotron etc. work on all ATARI computers - ATARI 400,800,XL machines,XE machines.

The XEGS carts - such as Rescue on Fractalus , Archon etc. require at least 48K of memory , some - like Airball - only work with 64K , so these games may not be compatible with the ATARI 400/800 , but will work on ATARI 800 XL/800 XE , 65 XE/130 XE , 1200 XL and XE Gamesystem and 600XL with 64K memory.

Mathias

ulrich_sternaxe@gmx.de

List :

Ace of Aces $7
Airball $8
Archon $6
Ballblazer $5
Crimebuster $7
Crossbow $3
Davidï¿½s Midnight Magic $5
Desert Falcon $5
Eastern Front 1941 $7
Final Legacy $5
Gato $5
Hardball $5
Joust $5
Loderunner $7
Millipede (large box) $4
Millipede (small box) $4

Moon Patrol $6
One on One Basketball $5
Pole Position $5
Rescue on Fractalus $8
Robotron 2084 $6
RS Football $7
Star Raiders 2 $6
Thunderfox $5
Tennis $5

Disk :

Mickey in the Great Outdoors $3
Microsoft BASIC $10 (heavy box ,weighs as much as 9 cart games)

Cassette

Scram $4
Touch Typing $5

For everything but:
1) playing the games, trying the demos which run on my HW.
2) testing the 'real' hardware capabilities.

For everything else I use emulators, they're faster to work with and I
don't have to use Atari keyboard (nothing personal, I just use PC
keyboard 15 hours a day/365 days a year and break instead of backspace,
no arrows etc. is killing me).

Check out this ftp web site <ftp://atari8@atari.xs4all.nl/> then click
on holmes archives then utilities. There are several demos, tutorials,
etc. that may help you. If you can't access the ftp site, send me an
e-mail and I will explain how to gain access. Also, I have the action
manual if you have any other questions.

I don't know what options are available in the Atari world, but there
is an Ethernet microcontroller successfully interfaced with the C64
and the Oric-1 (both 6502-based, and Contiki is working on the C64).

Since Adam has been running a (slashdotted) web server off Contiki 64,
I wouldn't call it a hoax. Maybe it is for you until there is a feasible
network solution for Atari computers.

> is only a report)

Reports are always welcome, thus how should I feel pissed? (-;

> *the fullscreen support using sdl seems to work, but instead of a
> fullscreen atari blue I got a big black border and a very small atari
> viewport. What the hell?!! When changing the pixel-size, the performance
> decreases dramatically. So why not changing the resolution?

Well, that's the SDL matter. It tries to find a screenmode that's close
to the required resolution (something wierd as 360x384 right now) and if
there isn't, it has to fall back to the black frame.

The easiest solution on Debian is to edit /etc/X11/XF86Config-4 and
enter the resolutions there. Unfortunately, a bit involved if you do
it by hand, but I could help you with my configurations (for a flat-
panel screen, though). It's a good idea nevertheless to put it into
the manual; I hope I'll get a vacation next week so I'll have some
time to work on it. (It = the manual).

> *where is the keyboard-shortcut descritpion? (where is the Atari-Key?)

In the manual. Either, it's installed globally, or if you haven't used
a "make install", in the directory where you compiled the emulator in.

man ./atari++.man

will give you that. Search (with /) to "KEYBOARD", and you'll find
a description of the keyboard shortcuts. It's near the end of the
rather lenghty man-page.

> *the compatibility seems to be a problem in my version. There are a lot
> of demos, which simply did not work properly. In my short testing time I tried
> Trip6 for example which crashed the emulation.

Note that Atari++ defaults to the XL os, not to the OsA operating
system. Might be different for the Atari800 emulator. This also
implies that you most likely want to press "Option" automatically on
boot to disable the Basic-ROM that's otherwise enabled. That's in the
keyboard section. If problems remain, please feel free to send me the
offending programs and I'll have a look. I'm quite interested in
problem cases.

> *the performance is also not the same as with Atari800Win .. at least my
> old PIII 500 has many problems with Drunken Chessboard, which runs
> perfectly but slows down when the vertex's are rotating or the chessboard
> is moving. Why? Is it because of the exact emulation?

Not too unlikely. The CPU emulation is not a stop-and-go emulation, but
a cycle-by-cycle emulation which is clearly more demanding. What you can
do is to allow the emulator to drop frames. Go to "Speed", there "MaxMiss".
Scroll the bar a bit to the right. This will allow the emulator to drop
some screen refreshes to "catch up". Typical problem cases are programs
that scroll screens a lot. My personal favourite ("Boulder Dash") is a
real stress-test for the X-frontend.

> *the pokey sound is much better than with Atari800Win ... at least I
> think so :-) ... the sounds are more "smooth" ... but as normal (this
> seems to be a general problem to all 8bit emualtions I know) there are
> some "clicks" and annoying "pop"-sounds when leaving or entering the
> menu or while loosing/getting the focus of the window

Depends a bit, also on the sound front-end. The best front-end I can
currently offer is the one for "ALSA". Unfortunately, installing a
recent ALSA version (you want something above 0.9.0rc7, 0.9.4 or better
would be optimal) on Debian means most likely you need to recompile the
kernel. All this will hopefully change with the 2.6.xx kernels that should
have ALSA built-in. ALSA runs the sound generation in a side-thread (not
quite, but leave technical issues aside for a while) that allows better
adaption to the system load. If drop-outs concern you, the SDL front-end
for sound should also work very fine for you, though it can't do magic
if all it has is an OSS-Sound underneath. HQ-Oss is the next best option
I'd say.

> *as for the compatibility again: Our5oft's Demo (disk 16 in the
> Homesoft archive) shows to the left the hires gr.8 mode in the middle the
> gr.9 mode (or gtia mode) and to the right only garbage. Maybe, the
> emulation is precise enough?

Well, just do it as follows: Send me the Atari binaries, describe how it
*should* look like and I'll see what I can do. (-;

As said, all this will likely happen next week should I find time. Matthias
send me a User-space version of the AtariSIO emulation in the mean-time,
most of the stuff is integrated into the 1.27, but not quite as I found

precisely zero time right now to do it, sorry. We had exams here, and to correct around 400-500 exams is not much fun...

So long,
Thomas

Do the MIO and Blackbox for example work on 800 ? The expansion port isn't there, so unless they made someting to make it work on 800, I think that's a plus on the XL. And if you find the right 800XL, the keyboard is actually very good. I have three or four 800XL's and only one with a good keyboard. The others seem to "give" when I press the keys (and I am not one of those punching keys). The 800's plus is the four joystick ports, the design, it can be dropped for a table and not feel a thing.

I love both my 800, 400, 600XL, 800XL, 1200XL, 130XE and all those XEGS thingies, but mainly use my 130XE

Source record: 20183

Dear Friends,

I must take exception to this ebay bashing. True, I have seen certain items sell for outrageous sums, but, the bottom line is no seller is forcing anyone to bid on their item. ebay is a buyer driven market, by that I mean, when a seller places something up for bid, he has no idea if it will sell or not, it's up to the whims of the bidders. Many times If a starting bid is too high the item will go unsold. If he wants to sell the item the starting bid will have to be lowered. In a free market arena such as ebay there are no hard and fast rules, bidders determine the prices based on their sentiment and their desire to own the items up for bid. I myself have paid way more than I should have at times, but, my mindset was that I wanted the item and I was going to get it no matter what the price, again, I knew what I was doing and no one forced me to bid.

As to the issue that ebay bidders don't support the Atari(or any other 8-bit) community by buying off of ebay is ridiculous. Look at it this way, the person who is selling the computer probably had it packed away for years going unused, but, we can assume the new person who bought the computer did so because they wanted to actually set it up and use it. We then can assume if the person is using the computer, maybe, they will need software, peripherals, and, other accessories for it, which might lead to them buying from the Atari dealers. Maybe they will even write their own software, and, possibly share it with others. All of these activities actually work to promote the community, not, detract from it.

I have been an avid collector of Commodore items for the past 20 years.(ok it's not Atari, but, the situation is the same for all 8-bit communities these days)

I have recently started selling on ebay, and, want to have a business of dealing in vintage computer items. I have a full time job and can only dedicate part of my time to selling. I don't have the time or money to maintain my own web server for a business, so, ebay is the perfect forum for my needs. Here is a recent auction I ran:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2738599152&category=1247&rd=1

Take a look, I started the bidding at a reasonable $9.99, I don't think the winning bidder got ripped off in anyway, look at all the software he got for his winning bid of $26.54.

This just proves there are bargains to be found if you look for them.

So think twice when you call it evilbay!!!

Well obviously people will use the Emulator because it is easier than
breaking out the old Atari Hardware and having to transfer the illegaly
downloadable disk images on the net to a disk to use on the real Ataris! ;)

Seriously I think it is becuase it is easier to just use ONE computer for
everything. Internet, email, Word Processing, and playing vintage Atari
games! :)

I personally like to use the real thing. I, however, can easily transfer
.ATR images to 5.25" disk using my Amiga 3000 and Amiga A1020 5.25" disk
drive.

Tim

Hi Tim-
Interesting... I know very little about Amiga's -- will it write out all 3 of
the 5-1/4" formats (90K, 130K, 180/360K)?
What software does it use to do this?

Larry

> What do you do with emulators? Do you own a real ATARI?
>

I own a real Atari (800XL w/ 256K RAM), which is on my desk, hooked up
to my Commodore monitor and stock 1050 disk drive, next to my Linux box.

However, my desk is small and cluttered, so the Atari often gets buried
under papers. :)

I would use it more, if there were something like APE for Linux.
At the moment, there's AtariSIO for Linux, but it doesn't have the pretty
front-end. :)

Since I haven't been doing much development FOR the Atari lately, I haven't
needed to use my Action! cartridge, so I've mostly been just playing games
on occasion, or looking at demoscene demos.

So... it's much quicker to download an ATR and throw it at Atari800 on
my Linux box, than it is to shuffle papers, make sure my SIO2PC cable is
bent 'just right' (it's a little flakey), and then try to get the ATR up
and running on my real Atari.

OTOH, I did play with an Atari800 I'll be selling this weekend at a
swap-meet, and am thinking maybe I should bring my 800XL downstairs to
play games with my wife and our friends every now and then.

She's got a laptop, so I might even be able to use my SIO2PC cable on it.
(When's the SIO2PC stuff gonna get packaged for Debian, huh? ;) )

-bill!

# 4282. Re: For what do you use Emulators?

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-30 03:05:11 UTC
From: Vader <replyto@newsgroup.please>
Message-ID: <HBGVa.5462$gn6.1301863@news1.news.adelphia.net>
Source record: 20195

As for me, I sold my Atari 800, 130XE, 1050 & happy-enhanced 810 disk drives, and my monitor back in 1990 when I got my first PC..... and that was one of the biggest mistakes I have ever made. If I only knew then what I know now, but at the time I was young and foolish (now I'm not so young). The day I found emulation was the day that I could, at least in part, reclaim that part of my past. I know that emulating the actual hardware and actually having it are two entirely separate things, and now I kick myself everyday for selling them in the first place. To me, the emulators give a link to a fondly remembered friend from the past...

## 4283. M.U.L.E.

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-30 05:03:35 UTC
From: Paul Allen Panks <panks@sdf.lonestar.org>
Message-ID: <bg7jj7$14g$3@chessie.cirr.com>
Source record: 20196

I've played M.U.L.E. on the C64, and it is a very plentiful game. Is it that rare on the Atari machines, for it to be so high priced on eBay? Or does the inclusion of a boxed M.U.L.E. make the price higher? (I would assume the later)

Sincerely,

Paul Allen Panks
dunric@yahoo.com

P.S. Anyone interested in porting some of my C64/128 adventure over to the Atari 800XL?

http://www.geocities.com/dunric/westfront.html

(scroll down to Commodore adventures, then click on the link)

All are (well are) 40-columns.

Sincerely,

Paul Allen Panks
dunric@yahoo.com

Yes there is a freeware tool called '551conv' that I use that writes all
Atari formats to the disks. Works great.

Remeber some people are prepared to pay a premium for the packaging,
especialy if its 'shop shelf quality'.

I could only ever find one shop in the UK which stocked M.U.L.E. at the
time.
Its not the most common game now either. Not only has its Rep grown over the
years but its release was at the time when Atari was not a major machine in
the UK. My Copy of mule is proberbly one of the most common type availabel
now in the UK, my Mule's have wooden legs and eye patches! And its proberbly
the game I play most on my Atari!

# 4287. Re: Full Motion video on ATARI again

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-30 12:53:44 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3F27BFD8.34B99C47@students.uni-mainz.de>
Source record: 20100

Well,
afaik the MyIDE supports a RAM card (it uses it like a harddisk, you can load and copy images from/to it). Of course you need some additional hardware to connect the Ramcard to the Atari, but this costs less than 10 dollars. A friend of mine already has a 64MB Ramcard and the proper hardware (MyIDE interface, small Ramcard "interface") installed in his computer and is currently testing it. If all goes well, we might look forward to another cool hardware upgrade at the ABBUC JHV in October. As soon, as the thing is released, plans and schematics will be available from ABBUC. So, at the moment it is a good idea to buy a MyIDE interface from Sijmen Schouten (the Ramcard works with the internal and external/cartridge version of MyIDE). But maybe in the future we will find other ways (hardware and software) to connect a Ramcard to the A8 (meaning without the need of a MyIDE)... greetings, Andreas.

> it no matter what the price, again, I knew what I was doing and no one
> forced me to bid.

Yeah but it just pisses me off when I look on eBay and see some guy selling
a new Atari 130XE for $149.99 starting bid, when I can go to any Atari
dealer and buy the same thing for one cent more!!!!!!

I am all for buying on ebay and have got some nice deals myself! Like a
nice Atari 130XE, 1050, 410 and a hidden bonus of a Happy Chip for $32!!!
And also a ok deal of a NEW in the Box XF551 drive for $142, which was a
deal as no New units are avail to be sold at dealers, and they wanted $175
for a refurbished unit. Thats the way bidding is on eBay, you can get a
really great deal one minute and over pay other times. Thats the nature of
the beast.

It is just a gripe I have of people selling items for what they can be
bought in a store/dealer. It is one thing to start it low (like you are
with your Commodore items!) and where it ends, it ends (thats fine!) and yet
another to start the dang bid at the same price it can be bought somewhere
else...

/RANT OFF ;)

upgrade.

# 4296. FA:Cheap ATARI XL/XE carts (Airball,Crystal Castles ...)

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-31 02:08:38 UTC
From: Ulrich_Sternaxe@gmx.de
Message-ID: <f16cbc23.0307301808.3cfdc1f8@posting.google.com>
Source record: 20109

Look at my auctions :

http://cgi6.ebay.com/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=klassische-videospiele&sort=3&page=1&rows=25&since=-1&showpics=1&stab=0

all the auctions are buy-it-now , so you donï¿½t have to wait until the end of auction - buy-it-now = starting price for most auctions.

I sell many rare ATARI XEGS carts for less than $10 - for example Airball , Rescue on Fractalus , Thunderfox,Loderunner,Crystal Castles,Necromancer , Battlezone , Blue Max - all the games are new/boxed+factory sealed.

I also sell factory-sealed ATARI 2600 "Fatal Run" for $10 , new/boxed "Ghostbusters 2" for $10 and many other boxed games.

I can accept paypal and itï¿½s possible to send up to 15 games in one package for only $14 worldwide !!!

This may be the last chance to get NEW + boxed games !!!

Please note : ATARI XL/XE carts are US - NTSC versions which are 100% compatibel with European PAL games !

ATARI 2600 games usually are PAL - that means the TV must be able to display 50Hz.

Mathias

# 4297. ADV: August's Atari Sale Days!

I'm currently having an Atari Back-To-School Sale! Games/Software and
Books/References are 20% off the top, and if it's Educational, take
another 10% off! A whopping 30% off for Back-To-School! This applies only
to Atari 8 Bit and Atari ST Computer Lines!

Due to Popular Demand, I'm extending my Christmas in July into August!
This is how it works. Buy the HardWare/Accessories for any Classic Atari
8 Bit and/or 16/32 Bit Atari ST System and I'll outfit your system with
Games/SoftWare and/or Books/References. You be good to me and I'll be good
to you! The more you spend on HardWare/Accessories, the better I outfit
your system. The more HardWare you buy for your system, the more Software/
Games and/or Books/References you receive! You choose the Atari Hardware
you want to buy and You & I choose the Books/References and/or Software/
Games I'll include in your Order.This will be a good opportunity to renew
lost interest in collecting Atari or building a New Atari system for the
first time. ReLive your Atari Youth! Offered While supplies last.
Goto http://BensCatalogs.Atari.org or Call Ben anytime at (503)256-9974!!!
To proceed with offer HotLink to:

# 4302. Trade 800XL for 800?

Newsgroup: comp.sys.atari.8bit
Date: 2003-07-31 19:42:56 UTC
From: misterbumpy73@wmconnect.com
Message-ID: <20030731154256.02382.00000751@mb-m21.wmconnect.com>
Source record: 20115

Would anyone out there be interested in trading with me? I have an 800XL w/XF551 in perfect working order and would like to trade for an 800 (at least 48K) with one or two 810 floppy drives.

I am trying to do this for compatability reasons and have several of my old Atari apps from way back when that either don't work with the XF551 at all or I need a silly translator disk for the XL. And no, I don't believe in translator disks... had Commodore come up with the idea we all would have laughed and we know it.

I'm just a stubborn old schooler, really and would like to just be able to put my old disks into a machine and fire them up directly. That and I miss having a bulky, beige 800 around. ;-)

If anyone is interested, please e-mail me or respond here and I'll contact you.

Thanks!
Louis

# 4303. Re: A very stupid question about printing to the screen...

>printing from ML

So this turned out to be not such a stupid question after all.
In fact, one of the first things you want to do in any programming
language is to print something to the screen, to see what your program
is doing. In the beginning it is the only visible evidence that your
program actually works.
This is why I wondered why this was not in every single text book
about the subject of programming on the Atari. Like K&R starts out
with printing "hello world", so should an introductory book on
assembly on the Atari 8-bit systems have some demonstration of the
proper way to do things, opening the E; device, or simply assuming
that it is open, and using CIO.
Sure enough, especially when you want to do a few quick programs with
just a few lines of assembly, a JSR $F6A4 is the quickest.
Maybe that is acceptable on the first few pages, so as not to scrare
programmers off by the "complexity" of the O.S. But this should have
been corrected if the $F6A4 method was shown initially. Most
programmers stuck with that though, and in later revisions of the O.S.
these adresses were moved, so programs crashed. Off course, you can
manually figure out where the routine is at now by looking in the
HATAB and then hard coding that new value.
To use a program to extract the address and use that is ridiculous.
How would one use that? A jump through a page zero vector?
Or maybe worse, copying the values and patching the JSR instructions?
Self modifying code is great fun, but it is not the way for beginning
programmers that simply want to follow the rules. Unfortunately, the
rules were hardly ever properly explained in those days.
The real reason the $F6A4 method was used is probably the fact that it
is hard to squeeze a full size program into page 6, so this was a
shortcut to keep the code small. I wrote a morse decoder in page 6.
Later I added just a few lines of code and it no longer fitted. These
were the lines to do it properly, but by that time I already knew
where the safe memory areas were, or what locations apart from page 6
could be used.
My fairly short morse code decoder is on the Pooldisk in the stack
directory. I did not want to include the source here, since this
message is long enough already, and some 275 lines code is not much,
but it shows that it is not much harder to do it right.

Keep those XL's/XE's humming.
Ernest.

Wasn't happy with the email, explained it was not the best way to stop
someone crossposting by making an implied threat, explained that an
email saying please stop was the best move or I might just sit in his
NG.

Bloke seemed reasonable...

Shame he decided to word the email badly, got my arse up initially
which only puts me in 'confront mode' and I'm a shite in that,
thankfully sorted nicely..

Apologies all around..

Good luck. 800XL's are alot more common than 800's also the 810 drives are becoming harder to find while 1050's seem to be prolific. That XF551 would be worth holding onto though. They are pretty hard to find.

While I don't have an 810 drive, I do have a Atari 800 at my parents' house back home. It has been many years since it has been fired up after I replaced it with my 130XE. As I remember (and assuming it hasn't been screwed by time), the only thing wrong with it is that the little metal uh.... "plate" that attaches to the underside of the cartridge flip-up lid has come unglued. It's still on the computer, it just needs to be re-attached.

The next time I go back home will be in a couple of weeks. If you're interested in it, I'll dig it out and test it. I've never even considered throwing it away, but if you are willing to give it a good home, I think that's a better life for this piece of history than to let it sit on a shelf and continue to collect dust.

I really appreciate everyone's help on this topic. With all of the manuals I
have around here, I finally found one with a clear exampe of how to do the
job that was described quite some time ago in this thread. The article was
"The Wedge" in Compute!'s Third book of Atari. After having read how it
works in a post here, I scoured my books and memory maps looking for the
routine in memory, with less than good results. To my surprise, even the
mighty "Mapping The Atari: Revised Edition" had no real description of how
to use the CIO to print effectively. So, I just wrote my own screwed up
little table and routine to stuff it straight to screen memory.

To run 800 apps on my 800xl, I used a software called "Be Hacker
Georges", anyone know it too ?

I had to boot on this disk, then put the 800 software, type "RUN E477"
then it boots the other floppy...

I still remember the 'run e477' ;) (i was very young)

hope it helps

# 4310. Security problem in Atari800 emulator for Linux (& Unix?)

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-01 14:47:40 UTC
From: rodsmith@nessus.rodsbooks.com
Message-ID: <ciudgb-tr.ln@speaker.rodsbooks.com>
Source record: 20123

Hi,

I ran across a security announcement in the linux.debian.announce.security newsgroup regarding the atari800 emulator. Here's a link to the announcement on the Debian web site:

http://www.debian.org/security/2003/dsa-359

In brief, a local attacker could exploit buffer overrun bugs in the code to gain root access. I don't know if the bug is in the main atari800 package, and so would affect other Linux distributions and even other Unixes, or if it's something in a Debian-specific patch. I don't see any mention of the problem on the main atari800 page (http://atari800.sourceforge.net).

I would avoid using JPEG format for Atari screenshots. The resolution is so low that the artifacting will stand out a lot more than in larger photographic images.

Plus the fact that the screenshots will have 'very few' colors (compared to a photo or photorealistic image - 3D render, painting, etc.)... JPEG's not meant for pictures like that.

I'd stick to GIF or, better yet, PNG...

<snip>
> boxshots & catalog pages (both in 320*200 & 640*480 JPG format)

JPEG is good for these. :)

Good luck!

I use XLIT .2 most often. Atari800win crashes some,
but is pretty good, but you wanted a DOS version, which
somebody already mentioned, Atari800 DOS.
Markus Gietzen is the author of XLIT.
Darek Michoca's Xformer classic might do.

All you need in the XL is a rom chip with a switch. switch up, normal XL,
switch down, rev B 800 os, sutibally modifyed to enable basic etc.

James

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

If you're looking for a web browser, one of sorts is called "Contiki". I've grabbed a copy, but haven't tried it out. I don't even know if my ISP will allow 4800 baud connections. ^_^ A google search will likely turn up something. After all, it was this newsgroup that told me about it. ^_^

Anyone remember those Color View programs by Jeff Potter, if I remember right? He came up with an ingenious method of displaying more than 256 colors on the ol' 8-bit by using 3 screens of Red, Green, and Blue graphics and then rotating them to mix the colors.

I knew for some time that Paint Shop Pro on the Windoze 'puter we got has a feature called Channels. It'll split a 16-bit image into its component R,G, and B values, each picture a 256 color grayscale image.

Well... How about I use Gifncode by the same guy, turn those separated R,G,B pics created for Colorview into GIFs and port them over, and see about mixing them by combining the pics in Paint Shop Pro using the Combine Channels option? ^_^

I had only 3 pictures that came with Colorview to check it out, the Super Girl image, the Unicorn image, and the Graphics 9 split of a Jukebox image (must be a 3-D glasses effect thingy). I converted them to GIF, loaded them in Paint Shop Pro, increased the number of colors to 256 per image, and then combined the channels into a 16-bit image. Surprisingly, the Super Girl and Unicorn images turned out very colorful, and properly colored as well. The Jukebox one was a little disappointing. But it proves that Colorview does work, and it's possible to create the component channels of an image that will have more than 256 colors using an Atari 8-bit, ComputerEyes, and color filters over the camera. Maybe it's not the sort of thing to do because it's far easier to just scan things or use a Snappy for videocapture... ^_- But it's cool to find this out.

ja ne nyo deshi punyoun...

>Mirko Sobe

Hello Mike,

I actually own two XE's, two XL's and one Atari 400. I also have a
32-bit Atari Clone (the Hades060). It keep my 8-bit disks safe I
use 800XLDJ which runs on my Hades060 (and also on a
ST,STe,Mega,MegaSTe,TT,Falcon,Milan) and emulates an 8-bit disk
drive. I first connect the XL or XE to my Hades using a SIO2PC
cable which is the same cable used in APE. The cable connects to
my Hades's RS232 Modem 1 port. I run the program, load in a DI
image disk, turn on the XE and the game/application program then
runs on my XE. I will storing these DI images on CD for future use.

Yep, I remember :) It would do 4, 2, or 1 bit per color, for 4096, 64,
or 8 colors.

Yes. So does Photoshop and The GIMP.

Jeff Potter

# 4327. Atari eBay auctions: 800/XL/XE SCART cable and RCA Phono Cable

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-02 22:12:13 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1059862484.17183.0@demeter.uk.clara.net>
Source record: 20138

Hello All,

I have auctions not far off closing for an Atari 800/XL/XE Monitor Port to SCART cable and an Atari 800/XL/XE Monitor Port to RCA Phono cable. These are suitable for PAL or NTSC systems (but NOT SECAM). They are useful if your TV output has become noisy. These cables use unmodulated composite signals to carry the picture and sound to the TV and give a far superior image to the RF (TV) cable.

I also have some very cheap TOSlink (optical) cables available, along with some DVD setup/calibration discs.

The link is below (this will split on to two lines, so please copy both lines into your browser):

><davidb81@earthlink.net> wrote:
>
>
>
>It's gotten to be such a headache for me that I almost gave up entirely on
>printing from ML
>
```

After following this thread the past few days, I remembered a ML prog I wrote years ago that used the put-character vector ICPTL (low byte) and ICPTH (high byte) in IOCB0. The resides at $0346 (ICPTL) and $0347 (ICPTH). The address stored here is the routine address MINUS ONE. This is because the routine is indirectly JSRed to (example follows).

To use this method, place the starting x-coordinate in COLCRS ($55) and the starting y-coordinate in ROWCRS ($54). (Since GR0 has a max x of 39, COLCRS + 1 would naturally be set to zero.) Then LDA with the char to print and indirectly JSR through the vector. Tada! Char printed on the screen. If the coordinates in COLCRS and ROWCRS are out of range, error code 141 is returned in the Y register and the N flag is set. Also, if the bottom of the screen is reached, it will scroll automatically.

Notice I stated STARTING COORDINATE above. The cursor automatically moves one position to the right, and wraps around at the end of the physical line. The cursor behavior is exactly the same as that in Atari BASIC's editor mode.

Here's one method:

```
LDA ICPTL0 ; SAVE IOCB0 PUTCHR VECTOR ON STACK
PHA ; TO SIMULATE AN INDIRECT JSR
LDA ICPTH0
PHA

LDA #'A ; ATASCII CHARACTER VALUE
RTS ; DO THE INDIRECT JSR
```

Alternatively, the vector plus one is stored elsewhere and you then JMP (IND) to it, as follows:

```
; SET UP PUTCHR VECTOR

CLC ; ADD ONE TO VECTOR TO MAKE IT
LDA ICPTL0 ; A "NORMAL" VECTOR ADDRESS
ADC #1
STA PUTVEC ; SAVE THE RESULT AS A VECTOR
```

```
LDA ICPTH0 ; THAT CAN BE JMP (ind) TO
ADC #0
STA PUTVEC+1

; GO PRINT A CHAR ON THE SCREEN

LDA #'A ; ATASCII CHAR VALUE FOR AN A
JSR PUTCHR ; GO PRINT IT ON THE SCREEN

; OTHER CODE HERE

.
.
.

; CALL THE EDITOR PUT BYTE ROUTINE

PUTVEC JMP (PUTVEC) ; NO RTS NEEDED AS THIS IS
; A SIMULATED INDIRECT JSR
```

I believe this general method (not the actual code) is used by Atari BASIC to print to the editor. I may be wrong...

"The Master Memory Map for the Atari" gives the details on the memory locations associated with the editor. I recommend reading up on them if you are not familiar with them.

Of course, one could always set up IOCB0 with the required parameters and call CIO to print to the screen, but this seems a whole lot simpler (to me, anyway).

Hope this helps!!

Hi, I am selling some RARE copies of the UK Atari Computer Owners Club magazine (aka Monitor magazine) on eBay. All mags are in superb, clean condition.

The UK Atari Computer Owners Club was run by staff of Maplin Electronics during the 1980s. The club magazine was initially called 'UK Atari Computer Owners Club' and subsequently 'Monitor', and sold on a subscription basis. It was a professional typeset publication with articles, reviews, program listings etc. relating to Atari computing (some ST content from issue 11 onwards).

Source record: 19997

Hello Karl

I only remember from version 6.0 and 7.0 and 7.10 software, however if you have the lazer/hyperdrive software (basically a cloned or hacked copy of the above) it should still work

However if you are using happy software with the lazer or hyperdrive you wont be able to use some of the later options (i guess that the software checks the hardware to see if pucker happy is installed)

But if memory serves me right there was a version of lazer/hyperdrive software that had all the happy options enabled, I did have this version but I accidently formatted the disk, and because I havent used my 1050 in several years I think it needs re:alligning, the later versions of the lazer/hyperdrive software had just the standard and non standard sector and track copiers, that other options were disabled or removed

# 4339. Pre-ordering available now: Flash Multi-Cart for Atari 8-bit Computers

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-04 01:52:57 UTC
From: Steven J Tucker <classics@atarimax.com>
Message-ID: <Z%iXa.9661$gi.4832389@news2.news.adelphia.net>
Source record: 20000

Pre-ordering starts today for my Flash Multi-Cart/Disk-Cart/Homebrewing Cartridge, with shipment of orders by 08/11.

The cartridge is professionally produced, with open-source software and extensive documentation.

Limited edition pricing is $29.99 per cartridge, with a shipping discount for buying five. After 8/11 the price will increase to $34.99.

For complete product information and the order form go to:

http://www.atarimax.com/

or directly to the MaxFlash cartridge page at:

http://www.atarimax.com/flashcart/documentation/

# 4341. Emulator newbie/help with M.U.L.E.

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-04 10:29:27 UTC
From: SteelWheel <stwheelREMOVEALLSOLIDCAPS@optonline.net.INVALID>
Message-ID: <3F2E3591.AED8105C@optonline.net.INVALID>
Source record: 20004

Hi group. A friend of mine decided to buy an old Atari 800 (must be the tenth time or so--he would do better to hang onto these things instead of selling them and then rebuying them). He got me sufficiently nostalgic to do some googling on my own, and now I've discovered this whole "keep the 8-bit machines alive" movement.

I've been running Atari800Win Plus 3.1 on my PC, and playing M.U.L.E. for the past few days (btw, I actually DO still own an 800 that was working last I knew, as well as a copy of the game, so I'm 100% legit here--just don't feel like hauling it out of storage). However, the graphics have been a little bit flaky--a portion of the "store" is not rendered correctly, making it impossible to see how many mules are in stock. Also, emulator seems to freeze up once every three or four times the wampus is captured. Are these problems common? Are these known bugs with this setup? I was considering trying to d/l and setup one of the DOS or Linux emulators instead hoping for better results, but didn't know if it was worth the effort. Anyone have any experience they can share here?

Also, are people actually using PC 5.25" disk drives to make copies of Atari format disks? And hooking them up to old Atari machines? I'm pretty sure my 800 is working (if I ever decide to get it out of mothballs), but I can't be quite so sure about my old Atari 810 disk drive. It would be great if there was a way to read all my old disks, if for no other reason than to store them in some more permanent format for the future.

Thanks folks!

Steel Wheel

```
Odd. I played that game to the very end. I was so good at it, that I
gained more lives than I lost. I quite playing when my score reached
1,000,000 with no end in sight, and I never used a map. The very last level
has NO torch at all, you go only by memory and when you win that level, it
level just keeps repeating itself over and over. It is not so bad though,
by the time you get to the last level, you pretty much know the rooms
anyways.

Bloody hell, you still playing with these 8 bits "William Kendrick" !

dont recognise any other names but my "senior moments" are grouped much closer together these days.

how many others from the 80's etc are still lurking in here?

just popped into the newsgroup to see if there was still any interest and low and behold the place lives...

those were the days.... still got a room full of the stuff upstairs. a man should go dig out his spartaX cart and try to remember how to drive it. Me thinks the R-Time-8 cart might need a new battery as well... hehe

truly inspiring to see the humble 8 bit still lives on

more power to you all.

I think the better method is to use an SIO2PC cable. There is a guy on ebay
that sells them all the time, very useful. It allows you to maintain your
copies on the PC like you use the emulator and hook up your PC to your
Atari. The Atari thinks that the PC is a disk drive, reading the image off
of the computer as it would a disk.

Can't forget that scene in Superman III when the bad guys are trying to shoot Supes down with missles by using an interface that looked like an Atari 5200 game. I read somewhere that scene was done with Atari Computers but have never been able to verify it anywhere else.

Here's where I read about it (somewhat) - this article about that got
a bit cropped:

Hi ZR!

> I once read in a magazine , that "Rainbow Arts" was porting some of
> their C64 games to the XL , for release on XEGS carts.We know , only
> Jinks was released on Disk and there is a 7800 version AFAIK.

A few years back I was emailing Julian Eggebrecht (ex-Rainbow Arts) about
the game Ataris commissioned from Rainbow Arts, i.e. Jinks, Bad Cat etc.

I can't remember what exactly he said but it was something along the lines
that Atari insisted on having those games on cartridges only (because of the
harder to do pirating) and not as disk versions, which seemed financially
not viable to Rainbow Arts.

> But in this magazine , ports of "Great Giana Sisters" or "Street Gang"
> were mentioned - but never released - maybe unfinished versions exist.

According to him, they do. Or at least, they did.

Once again, I may be wrong on this one. Could be that only Jinks was
completed (by the AMC lads) and the others weren't even started. Maybe I'm
mixing that up as well... (-;

In 2002 there was a thread in csa8 on Lucasfilm's Labyrinth which, contrary
to rumours, was never even started for the Atari.

> Anyone hunting for prototypes , especially in Europe ,were it&#65533;s
> possible that such games exist , games that were made after 1985 by
> smaller companies ?

# 4373. MIO HD on black box help

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-07 03:02:48 UTC
From: kheller2@mac.com
Message-ID: <6982911f.0308061902.75b20910@posting.google.com>
Source record: 20036

I have a Seagate ST125 connected to a MIO via an XEBEC controller that works just fine on the MIO. I'm trying to get the drive to work on a black box. I've flipped switch 7 to invert the data.. but I'm having some problems getting anything but boot errors. I've configured the drive settings to the best of my knowledge. Used 256 byte sectors. I'm not sure how the BB will store its partition information as that takes up 15? sectors. The MIO only used Sector 0 for this information.

Any help is appreciated!

Karl

Now that you mention it, it's the time of the year for my inquiry on Gunship for the Atari XL/XE... Yes, it DID exist, I wasn't dreaming (my cousin-in-law can confirm the story), and it isn't a case of misidentification of another game (Tomahawk). A German friend back in school had it, back then in 1987, he said he had got it from another friend of him; it was a double-sided disk, and he could make a copy of it (using the Happy Archiver for one side and some other thing for the other side, which he hadn't but his friend had) but then the copy would run only on his drive so I'd have to take his original disk. Unfortunately at the time I didn't have a disk drive, and my cousin-in-law wasn't interested; by the time I got an XF 551 next year, my schoolmate had already left the country and I haven't heard of him ever since.

Hey guys, thanks to TXG I have a 64k 600XL. I used this method http://atrey.karlin.mff.cuni.cz/~pavel/atari/600xl64Ka.html it works perfectly. I have a couple of questions tho. How do the other upgrades differ? http://atrey.karlin.mff.cuni.cz/~pavel/atari/600xl64Kb.html and http://www-users.rwth-aachen.de/mathy.van_nisselroy/xl600k64.htm respectivly, and is it possible to use the 1064 upgrade to give 112k of ram with any of these. I will do the satantronic 1088k upgrade next, but was just interested about the old 1064, I read some where long ago that it was possible.

dam the . disappeared... it was $1.10 and at 300bps it took a while to
download from toms or johns bbs's, but it was the only way to new stuff down
here in reasonable time :P

The ones I have seen and the 256k upgrade plug in board are very similar.
only differance is with the 74ls32 (U18). it is pulled out and a jumper put
into the socket 9 to 11 from memory, tho has been a while. also seen at
least 2 differant ways or sourcing the a14 and a15 address lines. either
way, they still work

# 4384. FS:Many boxed/new XEGS cartridge games

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-08 00:55:14 UTC
From: Ulrich_Sternaxe@gmx.de
Message-ID: <f16cbc23.0308071655.3d5db46b@posting.google.com>
Source record: 20047

Hi,

I offer the following ATARI XL/XE cartridge games by ATARI.

All the games are boxed and new , still factory-sealed in original shrinkwrap.

The games are US/English versions , they work on NTSC and PAL systems - there are no PAL-NTSC differences as known on the ATARI 2600.

I can ship worldwide.Shipping is about $14 for up to 15 , maybe 16 or 17 games (depends on the weight) or $7 (surface mail) / $9 (Air Mail) for only 1 game.

I can accept PAYPAL.Cash for very small orders or money orders/checks for bigger orders (because of bank fees).

Please note : The XL games in silver boxes - Millipede/Robotron etc. work on all ATARI computers - ATARI 400,800,XL machines,XE machines.

The XEGS carts - such as Rescue on Fractalus , Archon etc. require at least 48K of memory , some - like Airball - only work with 64K , so these games may not be compatible with the ATARI 400/800 , but will work on ATARI 800 XL/800 XE , 65 XE/130 XE , 1200 XL and XE Gamesystem and 600XL with 64K memory.

Mathias

ulrich_sternaxe@gmx.de

List :

Ace of Aces $7
Airball $8
Archon $6
Ballblazer $5
Crimebuster $7
Crossbow $3
Davidï¿½s Midnight Magic $5
Desert Falcon $5
Eastern Front 1941 $7
Final Legacy $5
Gato $5
Hardball $5
Joust $5
Loderunner $7
Millipede (large box) $4
Millipede (small box) $4

Moon Patrol $6
One on One Basketball $5
Pole Position $5
Rescue on Fractalus $8
Robotron 2084 $6
RS Football $7
Star Raiders 2 $6
Thunderfox $5
Tennis $5

Disk :

Mickey in the Great Outdoors $3
Microsoft BASIC $10 (heavy box ,weighs as much as 9 cart games)

Cassette

Scram $4
Touch Typing $5

I'm thinking it's 17 sectors for the BB. You won't be able to boot
that MIO drive on the BB till you replace the first 17 sectors with
the partition data for (96) 16 meg drives even if they are non-
existant. Then you'll need the dos boot sectors (3) and then DOS
on top of that. Faced with your delima, I would use another drive
to do the actual boot with and have the MIO drive as the second
unit on which I would use a sector editor to move the first 30 or
so sectors somewhere temporary. Not sure if I would even bother
at that point to try to get it working (bootable), but rather use
it to move files from there to the 1st drive.

Since you say you've already tried as best you can, it's probable
that the first 17 sectors are already trashed, if its a MyDOS
drive probably no biggy, but likely to be Sparta and as such your
VTOC and the first of the directory may be trash. You might still
be able to recover the VTOC using Sparta's Cleanup command if you
can get a decent Sparta boot sector where it's supposed to be and
the directory data working from a new location.

It's clearly time for a Sparta expert...I only dabble.

# 4386. Atari 8-Bit Computers: Vendors and Developers

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-08 08:34:39 UTC

Or you can always ask me for a copy at mailto:hunmanik@earthlink.net

UPDATES SINCE PREVIOUS POSTING
2003.07.27 Matthias 'Hias' Reichl (HiassofT) updated (WriteAtr V0.92b)
2003.07.27 Pecus and Pirx added (Scorched Earth, OMC65)
2003.07.13 Darren Schebek updated, new URL
2003.06.27 Mark Watson added, GP32 port of Atari800 emulator, version 0.3
2003.06.10 Super Products (James Bradford) updated
2003.06.10 Tomasz Szymankowski updated (Atari800Win Plus URL)

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Active" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, should NOT be listed here.
```

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

SAE/SASE/IRC info from http://www.genfair.com/greenpages/sae.htm
---
It is courteous when writing to any new correspondent to cover in advance their postage costs in replying to you. If they are in the same country it's a simple matter to enclose an SAE (stamped addressed envelope), which is known in American English as an SASE (self-addressed stamped envelope). It is not always obvious how to do this for correspondents in another country. One answer is to use International Reply Coupons.

An International Reply Coupon can be purchased at any Post Office in any country in the world. This is agreed through the Universal Postal Union. You can then send the IRC to someone in another country who can cash it in at a Post Office there for a postage stamp covering the minimum rate for an Airmail letter (unregistered).

One IRC enables a letter up to 10 grammes to be airmailed abroad. That's not much more than a couple of sheets of paper. So if you want a reply with more than this, better send two or more IRCs!

Verfications -> YOU!
---
This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

---

524 North Zee St.
Lompoc CA 93436
USA
tel: (805) 736-4624
mailto:paulalhart@hotmail.com
Vendor: used hardware--mainly reconditioned disk drives: 810 (no case),
810 w/case, 810 w/Archiver, 1050, Rana 1000, 1050 w/doubler, Indus GT
Developer: AtariWriter+ Companion (disk), AtariWriter+ Companion II (disk),
StarStuffer (disk), Search System II (disk), Atari BASIC Enhancements (disk),
8-bit TTL Logic Analyzer (disk), MagicCalc (disk), Games disk:
Jacks Cargoship + Light Pen/(Light Gun) Tic-Tac-Toe (disk).
Publisher: RANA Repair Guide (book) - US$12

Altronic E.I.R.L.
Bolognesi 952
Bellavista
Callao 2
Peru
tel: (51)(1) 429-4298
Vendor: New and used hardware and software
Repair Shop.

Alltronics - Electronic Component Supply 5/02
PO BOX 730
Morgan Hill, CA 95038-0730
USA
Phone: 408.847.0033 Hours 10am to 4pm Monday - Friday
Fax: 408.847.0133
http://www.alltronics.com/computer_miscellaneous.htm
Vendor: 1020 Color Printer, CX85 Numerical Keypad, CX80 Trak-Ball
Controller, ALPS/1020 printer/plotter pens

Guus Assmann 5/03
(with Marc Brings, Thomas Grasel, Harry Reminder, Carsten Strotmann)
http://www.strotmann.de/twiki/bin/view/APG/ProjUSBCart
Developer: Project USB Cartridge (USB Cartridge with two USB Slots)

Associated Enterprises (Victor Halling) (EMAIL BOUNCES 1/03)
2781 Houston Dr
Los Osos CA 93402-4309
USA
(805) 528-1117 (voice)
(805) 534-1117 (fax)
http://www.silcom.com/~halling/
Vendor: new and used hardware and software

Atari Bit Byter User Club e.V. (ABBUC) 11/02
c/o Wolfgang Burger
Wieschenbeck 45
D-45699 Herten
Germany
Tel./Fax +49 2366 39623
http://www.abbuc.de/
Vendor: PD/freeware/shareware, hardware, commercial software
Developer: wide variety including: SIO2PC(SIO2ST)-Interface,
PC-Xformer Cable, Automatic 2-Computer Interface, Switching Power Supply
(SPS),
8-Channel dig. Voltmeter (DVM), XL Switching Interface, Speedy 1050 upgrade,
RomDisk, QMEG+ 4.0, USB Cartridge with two USB Slots.
Extensive hardware schematics for sale.
Has obtained rights to many products including: KE-Soft, Klaus Peters
Elektronik, AMC-Verlag, Compyshop
Publisher: ABBUC Magazin (disk mag), ABBUC Sondermagazin (print mag)
Repair Shop.

ATARIX (paper magazine) 8/02
See: Satantronic

ATESIG
c/o Decker G. McAllister, Jr.
145 Surf Pl
Seal Beach CA 90740-5909
USA
tel: (310) 430-5433
tel: (310) 596-6123
mailto:d.mcalliste2@genie.com
Developer: hardware and software for model railroading applications

AVtoolbox 9/02
800-235-3280 or 859-647-1077
Fax 859-282-9995
http://www.avtoolbox.com/
Developer: a number of video<->VGA conversion devices, including the
Cheese Video Box. Connect your Atari to your PC monitor!

## 4387. Help - dead XEGS!

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-08 14:19:48 UTC
From: dunxuk@aol.commercial
Message-ID: <20030808101948.23687.00001706@mb-m27.aol.com>
Source record: 20050

Went to switch on the Atari this morning and was greeted by a black screen. Some times the screen is red, and other times it is accompanied by a single tone, but it never gets any further.

Any ideas where to start looking (apart for on eBay for a new XEGS!)?

Many thanks group!

Actually in many ways they are better than the 64!

-256 colors
-4 channel audio (though the SID makes for better music)
-easy to program (sound/graphics) basic built in (XL/XE line)
-superior I/O Disk Interface!

Both are great machines though.

I love the 64 and 8bit Atari.

Tim

Hey Schicklgruber, take it easy there. Actually, my first experience *ever* on any computer was at a computer camp in the early 80s (and how more 80s do you get than a computer camp??) on Atari boxes. 400 or 800 I don't recall anymore. They were pretty nice.

Oh yeah right! We all know it was you RaYzor that started this thread!
And since you mentioned my beloved TRS-80, it has 11 more CPU registers in
it's Z80 than the Atari has. To this date the Z80 is stilled used in alot of
controller applications. Don't get me wrong, I love Ataris, but the TRS-80
was my first real computer!

Which reminds me... Years ago, I had a TRS 80 given to me by my aunt who had no idea how to use it. It appeared ancient, even compared to the A800 I had at the time. The only feature it had that I found somewhat impressive, at the time, was a built in BASIC. I tinkered around with it a bit, but quickly lost interest when I couldn't find any peripherals for it (maybe I didn't look hard enough). The only thing I ever had was a cassette cable that I made for it from a cannibalized Commodore SIO cable and some jacks and crap I had stashed away. Then, some years later, I stumbled onto a Tandy/Radio Shack color computer III that I found to be quite impressive. I still have them somewhere, but I don't recall much about the CCIII other than the fact that it had 512KB of RAM. I still have both of them, along with a Texas Instruments computer (forget the model) that I never even messed with aside from making sure that it worked.

Were the TRS-80 computers very popular back in the day? In my little chunk of the US, everyone had 6502 based systems. They were either Apple IIs, Ataris, or Commodores.

> Many thanks group!

XEGS sometimes have troubles with Missile Command/normal mode
decisions. Put in a cart, turn it on, then pull the cart out,
and hit RESET. Alternately, power on with Option down, then
RESET. Fiddle with them all - it might just be locked into
'half' mode and it does happen often enough to be a known
problem, but I disremember the exact recommeded procedure
to cure it. Pulling the cart will not harm it, but will
certainly set hardware registers for a full ram clear and
cold boot routine to follow on pressing RESET.

If you've already tried the above and you know your XEGS and
this is not that problem - then it's time for a 2nd one.
Soldered chips make fixing them much more work. First place
to look is at voltage of power supply, #1 trouble. Next,
touch the ram chips if you dare, very hot ram chips mean
ram was fried by #1. If found to be hot, replace and try
a new power supply - you may get lucky.

>They were pretty nice.

IMHO Atari computers were quite technically impressive, specially the
smoothness of the graphics, large RAMs, and the colours.

Pablo.

Hm. I thought the Atari line had 128 colours, but I never checked
it out close enough to determine this number.

> -superior I/O Disk Interface!

Can you elaborate? Do you refer to higher capacity, faster transfer,
computer independent disk activity, less external hardware required
to connect a drive, fewer bugs in DOS calls or something else?

By the way, I thought we were past the hunting season for flames
this year.

<snip stupidity and profanity.>

For those of us who are sick of flamewars but interested in other computers, I was thinking of starting a thread comparing 8-bit multi user, multi tasking OSes, such as OS-9 Level 2, OS-A65, LUnix/LNG, etc.

Anyone interested?

If so, bring a wooden stake or some silver bullets for the trolls. They are not welcome here.

What about MP/M? Or was that a "serial multiuser" system, only allowing
users to log in one after the other?

Well, OS-9 _was_ available for the Apple II, with the appropriate 6809
coprocessor card of course :-p It certainly multi-tasked, I don't know
about multi-users though. Come to think of it, a BBS system with more
than one modem would qualify as a multi-user system :-)

No, no, no. A _real_ troll always calls it a MAC, either because they've
never actually used on, they're just plain thick, or quite likely they
know it pisses off Mac users.

Apple II - FutureCop:LAPD - iMac Game Wizard
http://homepages.ihug.co.nz/~rojaws/

---
To create a new standard it takes something that's not just a little
bit different. It takes something that's really new and really captures
people's imagination. And the Macintosh, of all the machines I've ever
seen, is the only one that meets that standard.

Bill Gates

>Ataris, or Commodores.

The TRS-80 was fairly popular in the Dallas area in the early and mid 80's.
What popularity they didn't lose to the less expensive 8-bits, they lost to
the Amigas, Atari STs, and the 386 PC clones.

One thing that made them popular in the late 70's and early 80's was
availability. You could find Radio Shack stores _everywhere_! :-)

What is? comp.sys.apple2? I'd say that's likely to be an Apple group.
comp.sys.sinclair is likely not to be about CBM machines either (although
you never know in there), and c.s.atari.8bit won't be about Commodore
either. Check what newsgroups a message is posted to before spouting off
about things like that.

> I think most CMBers disliked the Apple back in the day anyhow. LOL

Possibly. The C64 was always so much more expensive than the Speccy here
in the UK.

I believe it was 121 colors (the 8 shades of black don't count on the atari either).

I was seriously looking at the ataris when I was choosing my first computer..

Things that were sooo cool about the Atari:
- almost 2mghz 6502 processor
- FOUR joystick ports!
- Graphics and Sound commands built into thier BASIC.
- Stereo cassette drive (one track was data the other audio which could play when programs were loading!)
- Those really cool looking cases
- Somre Really Cool Games! (Asteriods, Missile Command, STAR RAIDERS! also some nifty ones from places like Adventure International, Big Five, etc.)

What I didn't like about the 400/800s
- Everything was extra (expensive too), BASIC, memory, serial and parallel ports, etc.
- BASIC was quirky (Dimming strings, etc.)

When it came down to it my $215 I had to spend (1983) would either buy:
- an Atari 400 - no BASIC, no cassette, no games - and I would have to borrow cash to pay the sales tax.
- or a Commodore VIC-20 and 1530 datasette with a bit to spare.

I bought the VIC-20 & datasette, and with the rest got a programmer's reference guide and the first Issue of COMPUTE!'s Gazzette magazine. It's been a blast ever since!

Comparing the bulk of the Atari Line to the Commodore 64:
- the Atari lacks the great sound of the 64
- the capacity of the disk drives (170k vs 90k)
- the ease of using the drives (no DOS disk needed AT ALL!)
- the interfacability of the stock computers (the parallel port was a great feature, it took Atari until the 800XL to finally put one in)
- and the 64 had more memory. (Before you say it, If you want to compare the second genration Atari 8-bit - the 130XE - you shoiuld compare it to the second generation Commodore 64, the Commodore 128. :-)
- Also on the graphics the 64 won in the sprite department for looks, the Atari Player Missiles were very bland and colorless (see Donkey Kong on both platforms for an example)

- 64 has more software, more games and more productivity programs.

Larry

P.S. Yep, I do have an Atari 400 and 800 now, because I like many of
the games. :-)

Things I thought were cool about the 800/400

Dude, it is called C-One. Officially it is no longer called Commodore One. As it is more than a "Commodore 64". Actually the C-One can probably smoke a speccy any day with 20 MHz and 65,536 colors and potentially capable of ALOT more color. Resolutions upto 1280 x 1024. OVER 16,777,216 bytes of memory. Capable of over 1 BILLION bytes of memory (1 WHOLE GIGABYTE of SD-RAM memory) just for main memory and 128 MBytes of Multimedia memory (Video & Audio memory)

Enough said. Learn more, go join the C-One Mail List. Since some of you would be newbies. I think it would be acceptable for most of those on the list to answer your questions. Jeri and/or Jens may be too busy to answer but others may answer you in order to update you and allow Jeri and Jens to focus on the project.

To end this in a positive "Speccy" note, the C-One can very well handle Speccy software when the "Speccy" cores are developed. I personally don't go into platform flame wars so guys enjoy.

## 4440. The 286 is Crap!

Newsgroup: comp.sys.atari.8bit

Message-ID: <iPlZa.175560$xg5.162703@twister.austin.rr.com>
Source record: 19953

I never really liked the 286, it's faster than an 8086- but not much. The machines they ran in tended to be heavy and bulky for some reason (IBM AT for instance). I loved that movie 'Hackers' with Angelina Jollie- the part where they were oohing and ahhing over her new 286 notebook that was running at blazing speeds. HAHA

I tend to remember that the SIO (?) connector used on the Atari may
be rather difficult to find these days, unless you sacrifice an
original cable to build some PC interface cable. Compared to that,
the 6-pin DIN used on Commodore's IEC interface is much easier to
locate (although it may have begun to go out of fashion now).

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

erm - isn't it actually a new Amiga and therefore absolutely nothing to do with the C64? And you're a commodore fan? Hmmm... T'other thing being that it isn't anything like an Amiga anyways, more of a slightly hacked up PowerPC Macintosh. Great! Welcome to the speed and quality of 10 years ago!

Ah - no I was thinking of something different. But if you want to see the Sinclair equivalent, then goto http://www.petersplus.com and take a look at the Sprinter:

Totally spectrum compatible, with 4MB of program memory, SVGA graphics, IDE support, CDROMS, ISA slots, and loads of other cool stuff ... Ah - you must see Doom running on it as well, pretty impressive :D

pardon my c-one ignorance, was obviously thinking of Amiga-One (or is that a-one?)

Nope it is not (Amiga and Commodore in any case are two different
companies) (Commodore is owned by Tulip)

The C1 can be seen here: <URL:http://c64upgra.de> and I am have to say it
is pretty impressive... and although not yet available since it's in
Germany I'd imagine a lot easier to get than the Sprinter which is in
Russia (ie I've sent $$$ for a Sprinter 2 years ago, they never received it
and if it weren't for Western Union I would still be trying to figure out
what happened with it). The C1 also has a PCI slot and it's regular ATX
compared to the not-so-standard Sprinter size

Also the sprinter can be ONLY a Z80 computer while the C1 can be whatever
the heck it wants. It is a REALLY good design (oh well here I am committing
the sacriledge.... in any case judge for yourselves)

Take care

Hmmm - Yeah, but you have to stick a CPU in! That's hardly very impressive is it? In actual fact this machine is almost exactly like the sprinter (using Altera Flex chips as a reprogrammable chipset), and being ATX - all the connectors are built into the board, which means when they go, the whole machine goes ;| True it looks quite nice, but it's just a Sprinter with a CPU slot to be hardware compatible with some other 8-bit micros. I don't know what is c64-like about it, apart from the Monster-SID (which sounds very much like a standard DAC to me), and the fact the standard firmware configuration will be for c64. Jus' my thoughts ;) Certainly not crap tho, a very worthy project :D

It is indeed, I was more commenting on what actually is there... as Greeks
say: if my Granma had wheels she'd be a bus :-) Meaning of course that we
can't theorise on how the Sprinter would or would not be if it had a cpu
slot. Having said that of course the Sprinter is definitely a super product
and I will be in the near future attempting to get one (yet again)

But I was commenting more on the ability to reach major markets and it's
manufacturing quality...
Now on the c1 site you can see even the manufacturing process if you know
what I mean... And in any case I'd take MonsterSID anyday over an AY... not
that there's nothing wrong with an AY but compared to Monster SID is
limited (sound wise...)

Now a Spectrum is always easier to program...

And of course having said ALL of the above, the choice is really clear...
Get a Q60 (QL compatible) that blows them both of the map :-)

(www.q40.de)

Cheers

Sprinter has the AY programming in a flex chip, so I guess it could be programmed into some other sound-device if they wanted, also it has dedicated covox sound with an 8bit DAC, which is also accesible from within ZX Basic in Sprinter mode. So with the extra CPU horsepower and a proper DAC you don't need a 3-channel FM synthesiser really. Have you heard the AY Riders Atari-ST AY tunes? They use some very silly methods to output samples with proper filters and ring-mod a la SID, so it would be easily achievable for the Sprinter to sound just like a SID anyhow (with some more dedicated coders :) Though I would guess the main reason to get one is just because of the Russian Clone compatability, I don't think I've seen Walker and Dune 2000 on the C64? I don't suppose it would look very nice anyways in superblocks colour mode...

Errr... it is a reconfigurable computer based on the FPGA technology with
the option to various kinds of CPU cards containing various CPUs. 1 GB of
SD-RAM is rather large amount of RAM. I suspect that alot can be done.
Don't use over-bloated software. I generally support multiple platforms and
am not interested in getting into flamming others due to their platform.

To be honest, I am working on an OS that would be portable and run on
several platforms. The C1 does challenge me to develop an OS that is not
particularly dependent on the CPU.

Open the side of the case and insert it like a cartridge. It isn't as
painful as inserting a Pentium IV. It is the same way as you insert a
video card. Turn computer off, remove panel on the left (when facing the
front of the case), unscrew & remove old CPU card (if there is one),
insert new CPU in brown (AMR-like slot) and screw it in and then panel
back on.

Anyway, the cool part is that the SuperVIC & MonsterSID are merely binary
code loaded into the FPGA chips. You can always load different binary
files ("core" files and must be a synthesized FPGA compatible binary).
The cool part is that this can be done on the fly.

It is even possible to hybrid a new computer platform or even a whole new
platform. The C1 is actually a fun little thing. It was expressed that we
wanted something more then just a c64. In all ways, Jeri has achieved
that and then some plus going further by implementing several cores. It
will take time but the thing is time really doesn't matter.

Not totally. AFAIK, I don't think that it is possible to emulate a QL at
least not with a soft core... but again I may be wrong
I would like to see a PCI enabled QL though. Although the Q60 is good
enough as it is (68060 CPU and under Linux it even emulates both the C64
and Amiga :-) -oh and Atari-)

MP/M was a real multi-user system. The biggest limitation was the 64K
memory constraint (effectively about 48KB per user with banked memory) and
serialized access to the disk system.

There was also a standalone multi-user version of North Star Basic. I
believe The Byte Shop sold it. They modified the regular NS Basic to
support a limited context swap so several users could run Basic. Sort of a
poor man's RSTS system.

Nope the 1Mb cann't be upgraded. It's a limited version 1 to 100....

The later versions with MMC cards will support 4-8 up-to 1Gb I heard.

Join the forum of the atari flash-card to discus specific things about this
nice hardware.

Forum can be found at: http://www.atarimax.com

For a start, why jump to the conclusion that GigaTroll "must" be a
Speccy fan? From the crosspost, this particular thread is at least as
likely to have been posted from the Atari newsgroup (perhaps more so,
given the ST/Amiga flame wars)...

Incidentally, shit (when properly processed) is very valuable, as a
plant fertiliser for instance... :-)

Because considering the statistics it is a reasonable assumption.

Along those same lines there was also the original MUMPS, which was both a
language and a multi-user OS.

And I also worked (briefly) with a FORTH system which basically did the same
thing, but in a somewhat more general manner. Three or four users on a Z80
with 63K (yes, six three) of memory.

Actually the C1, the CPCNG and the Sprinter - all look like excellent
projects indeed.

Bugger the "my computer's better than your's" bollocks - i'd like to see an
independent comparrison of all 3 machines's features actually....

Again, add something that's ACTUALLY available to the list ie: the Q60 (QL
compatible) and then we'll see even better ;-)

Yes, sorry I was thinking of Amiga-One which is a totally different kettle of fish, and is indeed, a few years out of date before it's even released. As I've said in previous replies, the C-One looks very nice, and I would have no reason to flame anyone about it :)

What I meant about CPUs was that it isn't some sort of uber-clever machine that will allow the spectrum to be emulated, but in fact you have to plug in a Z80, and get the FPGA chips programmed with the correct chip emulations to get a result, which in essence means you'll have to be ripping a card out and plugging another one in when you change machine types.

Still very nice flexible architecture, but I suspect the Speccy modes will be limited to simple Speccy 48/128 types, and not the more advanced clones, unless someone proves me wrong ; )

Well that's not really an 8 bit ;-) more like an 32 bit ;-) Used to be
classified as an 8 bit though (as a QL that is) but it's a lot more than
that :-)

It is by far the MOST powerful of all older platform spinoffs

First of all, I am not sure at all it is available... about a year ago when
I wanted to get one to try and port SMSQ/E (a QDOS derivative) on it I met
the deafening silence from Medusa. Second the Q60 runs max at 80 MHz. Last
it's extremely easy to program as opposed to the Hades and finally is
almost half price :-)

Thats cause, the true name of Macintosh is MACINTRASH.

Completely overpriced, gaudy looking, no games / few apps junk. They had to
kill their legendary (and completely terrible) OS they struggled with for
years, and touted its prowess, to adopt a bastard of UNIX so it MIGHT be
stable. Heh.

Advocates of Mac's are of course joining the ranks of Amiga, Atari ST, and
Amstrad .... extinction is on the way!

Also hello, and if you think this is trolling, please get a life. I state
facts.

Hi, I am selling a boxed disk game on eBay - Sargon III Chess by Logotron .

The cardboard box contains three disks - Program Disk, Opening Book and Chess Problems. The disks contain a version for the Atari 8-bit machines on side A, and for Commodore 64 machines on side B. It also includes a detailed instruction manual. All in excellent condition. A rare collectors item.

Ok, need a '060 CPU. Ok. Well as for most other chips in such a machine.
This could be done. Though a Timex Sinclair (classic) can be with no real
trouble from a technical sense. Though you would need a documentations of
the core but can be done.

Though we are talking LE. I also look at the C-One as the basis for a
standardization in modern Reconfigurable Computing. This platform can
exceed well beyond even the Splinter or any other RC platforms. Also it is
the only one that is ATX. Meaning, increase the size capacity of the FPGAs
and even more can be done. Not bad for a "non BIG-CORPORATE" project. I
wouldn't call iNDIVIDUAL COMPUTERS corporate.

Mostly due to the '060. Though the C-One can serve as a basis to more advance versions. Actually the FPGAs reprogrammability would feel more like loading a program into RAM from a typical user point of view. From a programmers perspective it would be more complicated but not that bad. You would be "virtually" plugging in and out cards in a plugin' play kind of fashion perhaps. Just make sure your memory mapping of hardware will not cause you conflict. Let this be for the geniuses. For you, hey it'll be explained to you and would not be that hard to figure out.

The most hard part will come in designing the "cores" itself but that is another story. If it is already made, it is just up to software to load it in and map them out.

I suspect the C-One is probably the best due to several key elements:
Memory capacity, Size capacity of FPGAs and CPU speed is not explicit to
any one CPU and is just fine. Price is quite reasonable. Most others are
old AT specs. C-One is ATX. C-One carries essentially all the features of
Splinter from a hardware level. "Cores" don't matter, really. Then this is
my opinion.

The C-One can very well branch into the 32bit arena. Just need a 32bit CPU.
System bus of 66 MHz ~ 105 MHz (possibly 135 MHz). Sinclair QL is also not
a "Reconfigurable Computer" from the perspective of reprogrammable FPGAs,
reconfigurable on the fly. Anyway, this is the general thing that makes it
pretty difficult to compare the two. Like one is an Apple and the other is
an Orange. Both fruits but each have their differences. I would compare the
C-One with other "Reconfigurable Computers".

|Forgot to add - the CPU is 21mhz :)

Compared to machines that run Windows, what's the mean time between crashes? Half an hour? Since many people buying the C-One want to put up a Windows emulator for more perfect emulation of that damnable abomination (hack, spit, ptui), isn't it true that they will be trying to cut it down to once a week, or better? And that is quite an improvement, don't you think?

Actually the Apple IIc/e/gs have supported limited multitasking under ProDOS
since ~1990; >shameless plug mode< see the 'Daemon' program in the archives
for more details.

## 4488. Atari 600XL video port mod?

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-11 05:07:04 UTC
From: Tim <tjlazer@nospam.mail.com>
Message-ID: <vje93q35p2vb7@corp.supernews.com>
Source record: 19901

Anyone here done a video port mod on a 600XL? I am thinking of doing one on mine. But need some tips as to where to install the port. If anyone has advice or pics of the install that would be great.

Tim

Not true Matthew. Some people maybe. You'll get that but the real question
would be "WHY?". I have my own ideas and I like to explore those ideas on
the C-One. It is not just a machine, it's an adventure.

Enjoy!!

> is it?

It comes with a 20MHz 65816 on the board. If you want something else, you
can pop it out and use the CPU slot for a different processor, or just
disable the '816 and run a CPU on the FPGAs themselves.

> I don't
> know what is c64-like about it,

There isn't anything c64-specific besides the SID sockets, a cartridge
connector, and CBM serial port. That's why it's not called the
"CommodoreOne" anymore, because it's not just a Commodore anymore.

> apart from the Monster-SID (which sounds
> very much like a standard DAC to me),

Except is has the SID oscillators and filters as well as wave sounds.
Besides, it and the SuperVIC are simply FPGA programming.

> and the fact the standard firmware
> configuration will be for c64.

It's just software, and more will be available as they're made (by the C1
developers themselves, not just by the "community"). You can select which
FPGA set to load at bootup from a flash card (or any other IDE device).

> and plugging another one in when you change machine types.

There should plenty of FPGA space to emulate both a Z80 and all the speccy internals. That means load up the speccy core into a flash card, pop it in the C1, and boot it up. You can even have multiple cores on 1 flash card and select between them at boot time.

Jeri's said that it might even be possible to stuff a low-end Amiga into the FPGAs.

> Still very nice flexible architecture, but I suspect the Speccy modes will
> be limited to simple Speccy 48/128 types, and not the more advanced
clones,
> unless someone proves me wrong ; )

There's currently a jacked-up 6502 I/O processor, IDE controller, VGA framebuffer, and all sorts of crap just in the smaller (30k) FPGA in the default core. The other one's a 100k gate FPGA, so there's quite a bit that's possible.

tim,

i have done the video mod for my 600xl. i just used the audio and the comp. out. then i just squeezed in two rca jacks on the left side. this is really easy to do, getting the signals and a graoud. putting the rca's was harer. i can send you a pic but i think that would not work...

peace

> I never really liked the 286, it's faster than an 8086- but not much. The
> machines they ran in tended to be heavy and bulky for some reason (IBM AT
> for instance).

I gutted one of those machines a while back and used the power supply to power a car stereo I installed in my took box at work. The rest of the computer (except for the floppy drives! I got a 1.2MB 5.25" out of it!) found it's way to the dumpster, but not until after I had some fun with the hard drive.

Just like the Atari's, man. They were great in their day. Now, like Rodney Dangerfield, "they don't get no respect".

I loved that movie 'Hackers' with Angelina Jollie- the part
> where they were oohing and ahhing over her new 286 notebook that was
running
> at blazing speeds. HAHA

Um, there's a few things there that don't add up. First, that movie was made in '95. At the time, we had already seen Pentium systems. On top of that, Angelina Jolie, Johnny Miller, and Matthew Lillard were yakking about how "RISC Architecture is going to change everything" while they were drooling over it. Ever seen a 286 with RISC?

I liked the movie simply because I found it to be totally hilarious by how "off-the-wall" it was/is. I laughed myself silly over how "Zero Cool" pirated his phone connection at the beginning. Good movie, as long as you don't take it TOO seriously.

You can def. toggle the font on the Atari versions but I can't remember
how - too far back. It's in the documentation though that came with the
games.

Hello,

I've published a little tool (Source and Binary) that shows some information
useful during ACTION! Programming:

# ATARI RTClock Timer Ticks
# Shift Key Status
# X/Y Screen Cursor Coordinates
# ATASCII Key-Code of last pressed key
# Interal Key-Code of last pressed key
# ACTION! Base Adress (ORG)
# ACTION! Program Code Size
# Last Sector IO Number

The Tool can be downloaded at
http://www.strotmann.de/twiki/bin/view/APG/ActionInfoLine

Have fun

Carsten Strotmann

Well its just the use/troubleshoot gap that has widened extremely. Old
systems took some getting used to but after that you knew enough to
handle problems as well. Nowadays the pointy-clicky stuff that john q.
user needs is easily enough picked up.... but woe if something goes very
wrong. then you've got a capital PROBLEM. At least with Windows you do.

Why waste LE space emulating the z80 when you can still get them from
Zilog. For probably less then $20 now, you can get an eZ80 which is
backward compatible with the classic z80s but has many addition features
built-in. It runs at 20 MHz and 50 MHz. It may go even faster. So why
waste the space. A simple ez80 CPU card is no real problem. You can
always use the PCI if you feel the CPU slot is too limiting.

Yep, the 6502 (we sort of call the 65JE02 or 65J02)

I suspect the c65 mode is quite easily doable. Just need the specs on the new features of the VIC-III and a 1581 drive. Like all other built in drives made by C=, it was done in the same way as the 128D. So just have a 1581 drive assigned with device #8 and you're fine there. The C-65 would be just a variation on the c64 FPGA "cores" and having BASIC V10 ROM, C65 CBM DOS & Kernal ROMs as well. As for the rest, I suspect it would be possible to "emulate" or "clone the internal hardware". I would think detail specifications would be required. How else would you properly emulate hardware ? You need detail documentations on how the hardware works.

A Z80 A costs $1.99 retail (and so is a Z80B too btw). A Z8xxxx (don't
remember the nos) like the one used on the sprinter costs about $5.00 and
so on.

A complete Z8 MCU evaluation kit goes for 49.95 (retail)

Alternatively, why not send a mail to llortagem@yahoo.ca saying that his message was somewhat impolite and you'd rather he didn't post things like that thankyou very much. It will have approximately the same effect, he'll probably find it equally amusing, and you'll save him the bother of spending two minutes signing up for another throwaway Google Groups account.

Yes, but we are talking 4.7 MHz devices or 10 MHz but not 20 MHz and 50 MHz devices. I know the z80 and z800 and z8000 or z80000 weren't that expensive. A eZ80 is also capable of addressing 16 MBytes of RAM directly like the 65c816. All you have to do is use the SD-RAM Bankswitcher mechanism that Jeri integrated into the FPGA to handle memory larger than 16 MBytes like upto 1 GBytes.

The eZ80 was as low as $12.00 but I have to check current prices.

Take a look at Digi-Key's price quotes. They will give you a reasonable estimates.

http://www.digikey.com/scripts/us/dksus.dll?KeywordSearch

The EZ80190AZ050EC chip is $24.69 for one but in quantity bulk of 500 would be $10.62 per chip. So hey with if you have $6,000 then yeah, go for it.

It wouldn't be that hard from a technical point. It will actually be quite easy. The only thing that we need is specs on the hardware and detail documentation on the way the chips were made and its functionality. 128 colors, no problem. Even the 32768 color add on can be emulated too. We can make a Super (SAM Coupe) Video core using the 65536 color table used by the SuperVIC and you can have "Chunky Video" mode. The hybriding of the core. How would that sound ?

Use an eZ80 at 50 MHz. So we got speed, 16MB of addressing and 65,536 colors.

# 4520. "Computer Gaming World" issues wanted

Newsgroup: comp.sys.atari.8bit

From: Darkstar <darkstar@magma.ca>
Message-ID: <meZZa.2764$kp4.391801@news20.bellglobal.com>
Source record: 19934

Hello!

A few months ago, I finished moving my things from my parents' house to
my house. I found an old box with my "Computer Gaming World" magazines,
back from when 8-bit computers were king! It was interesting reading,
and I'd like to complete the set. I'm curious to know if any fellow
8-bit users would have the old issues I'm looking for, which are as follows:

1.1 (1981)
2.1, 2.2, 2.3, 2.4, 2.5 (1982)
3.1, 3.3, 3.5, 3.6 (1983)
4.1, 4.3, 4.4, 4.5. 4.6 (1984)
#74, #76 (1990)

As well as "Computer Game Forum" issues #1 and #2 (1987 or 1988?)

Let me know if you can help! I'm willing to buy/trade, as you prefer.
Thank you!

darkstar@magma.ca

> Thats cause, the true name of Macintosh is MACINTRASH.

I remember when I used to say the same thing some 10+ years ago; I swore
that the only Macintosh I would buy cost $0.89/lb.

Now I actually own a few, but given the prices on eBay and at my local user
group, $0.89/lb. is still about right. :-)

Seriously though, I think I've lost count of the many lines of computers
introduced and then later abandoned by the folks at Apple Corp. (TBP "apple
core?")

Among the many:
- Apple (I)
- Apple II
- Apple III
- Apple Lisa
- Apple Newton

Have I missed any?

You lose count pretty easily - that's only five! There was also the
eMate which was a repackaged Newton with a keyboard. It is a shame that
the Newton got dropped. I think the never ending criticism of its
handwriting recognition sunk it - that and Apple's then dodgy financial
state. I never used but I did try out an eMate and it coped very well
with my scrawl and I much prefered the natural handwriting recognition
to the PalmOS Grafitti text entry system.

Abandoned is probably a bit strong for the Apple I and ][ - the Apple I
was just a board made by Woz in Jobs' garage. The ][ had a pretty long
life - yeah the zealots will quote 'Apple ][ for ever' but it was
obvious that the Mac was Apple's future. Lisa was just too expensive -
pre-emptive OS and memory protection was going to cost you in those
days! Did anyone buy the ///?

The Lisa (IIRC was later marketed as the Macintosh XL) was pretty kick-a$$
machine for it's time (actually even for now... Mac OS did not get back up
to these kinds of specs until System 8 and later and not even then...
probably the only things that come close are the NeXT and OS X).
As for the III, YES I DID HAVE ONE! And not only that I did have the
portable (ie terrible) LCD screen that went on it (worked with the II(e?)
too). Pretty cool stuff!

# 4531. Re: MIO HD on black box help

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-12 10:24:37 UTC
From: jim <sup8pdct@mail.cth.com.au>
Message-ID: <Ff3_a.525$U74.28692@news.optus.net.au>
Source record: 19944

The 17 sectors is for the partition list that is used to swap with the 8 that are loaded at boot time.
the First sector of the harddrive contains the partition table for both the BB and MIO and is loaded at boot up of BB/MIO. they are both not compatiable tho. If you know the start and ending sectors of the partitions on the harddrive, it is easy to build up the partition table for the mio, then use a small utility to save the partition info to a file. that way, you don't overwrite the BB info on the first sector. I have used that for my setup, as I have both BB and MIO and can use the harddrives on either.

the 17 sector partition list saves 96? partitions, idea is to select one and swap it for any of the 8 that are accessable at any one time. have used this method to put boot disks with games etc on to hard drive.

> Did anyone buy the ///?

Actually, the *only* Apple ][ machine(s) I've seen were accompanied
by an Apple /// machine (although not powered on). Of course, this
was in a computer museum which is the only place where I've seen the
Commodore PET and CBM series too (not to mention the only place where
I've seen TRS-80 and plenty of CP/M machines).

Unfortunately, I think this museum only was open for one season, and
all the machines[1] were stored away somewhere -- because they couldn't
have been thrown away, could they?!?

[1] including Altair 8800, Osborne-1, a room full of IBM PC clones
and of course a couple of VIC-20/64 and Atari -- sorry, but I
didn't see a single Sinclair computer in this "personal computing"
museum.

<mpender@hotmail.com> writes
>Among the many:
>- Apple (I)

Not really abandoned, as it was merely replaced.

>- Apple II

Well, if you think being developed from a 4K, 8-bit machine into a 1Mb,
16-Bit machine with 15-channel stereo sound, but almost entirely
compatible with previous versions, is abandoning... and continuing to
produce and sell 8-bit versions until 1991, actively developing the
hardware to reduce the chip count to 4 ICs in the last ones/LC //e
cards...

>- Apple III

It wasn't abandoned, it flopped. Big difference ;)

>- Apple Lisa

Evolved into Macintosh, and despite the lack of sound, complicated
physical construction and such, was continued alongside it as the Mac XL
until the Plus came along. Not really abandoned, then...

>- Apple Newton

I'll give you that one. Perfectly good platform, perfectly good
hardware, perfectly good OS. No reason I can see to can it, other than a
good relationship with Palm - which is of course why my Wireless Palm
can synch to PC over WiFi, but has to be plugged into the USB base to
synch to my G4...

And the Bandai/Apple Pippin.

Compare that to Atari:

400/800/XL - from 1979 to 1986, technically. XE development stopped at
the XE VGS (not so much development as repackaging).

2600 - from '77 to around '85, but sold for ages by dint of them
producing waaaay too many. Incompatible with the 400 computer line.

7800 - about a year. Technically '79-ish, but put on ice for so long it
wasn't sold until what, '84? Incompatible with anything else.

5200 - repackaged 400 but not compatible - until emulators came along.

ST range - incompatible with earlier 8-bit.

Falcon - barely compatible with the ST range.

Need I go on? And lets not even get started on Commodore, who used every
CPU going around the time, from 6502 to Z80 to 6809, plus 3 or 4
different video chips... 384 range, anyone?

It worked like this:

The Apple II adopted it from S100
The IBM PC adopted it from the Apple II
The Macintosh II adopted it from the IBM PC

<g>

Of course all these open hardware buses were all mutually incompatible
with one another. Thus an S100 expansion card didn't fit in the Apple II,
the IBM PC or the Mac II .... et cetera for the other buses and their
expansion cards.

The P-series (6509, actually), and the SuperPET 9000 as a co-processor
in the MMF models. They also offered 8088s. Forgot about that one ;)

And we're both wrong. It was the 264 range. The 364 was an upmarket
model, and the 232 was a cheap model (as was the 116), but they weren't
seriously released.

Andreas,

Yes, 1 Megabit is 128K-BYTE. This is explained on the first page of
the cartridge documentation and many times thereafter. ROM and Flash sold
as chips are always rated this way. For example the bootleg cartridges sold
by Sunmark are described as 'Mega Carts', these are mega-bits not mega-BYTES.

You are also correct that 128KB is not a massive amount of space. Its
enough to hold one disk game + drivers and maybe a translator, or many
small EXE games + a loader and translator.

For $29 US it cannot be made a mass-storage device. Its intended
to be for homebrewing of cartridges and a open-source alternative to bootleg
ROM multicarts, which cannot be re-programmed and are selling for even
more money.

1Mb is twice the capacity of a Spartados X cart. Its quick to
re-program, the burn images fit on ED floppy disks, and the price can be
kept to a reasonable hobbist level.

I will try to make it clearer on the introduction web page that 1Mb
is 128K-BYTES for those who do not read even the first page of the
product description where this is explained.

The original poster says he's tired of flamewars, but he wants to start
a thread that is most likely to evoke controversy. People who respond to
this thread might want to look at the message "header" for the list
of SEVERAL newsgroups to which this thread is directed:

*** Newsgroups: comp.sys.apple2,comp.sys.cbm,comp.sys.sinclair,comp.sys.atari.8bit,c
omp.os.cpm

Anyone interested in all these systems or any of these OS's would be better
advised to ask specific questions, it seems to me, rather than put messages
about CP/M vs OS-9 in newsgroups where neither is relevant. The Web has many
Web sites devoted to one or more of these OS's which would be much more
informative to read than a long and unfocused cross-posted discussion.

ONe might also do a google search on "trolls", that is also very informative.

This is a a bit over-nostalgiac, I think. System 7 had pretty much everything
Lisa 7/7 had and more, with the exception of stationery. (Apple has
tried to re-introduce that feature a number of times but never
successfully)

Well yes that would be great because at quick glance without extensive in depth reading reveals 1MB capacity. Which as we all know in the computer world is 1 Megabyte (1024 Kilobytes). Maybe use "1 Megabit" or "1Mbit" instead of 1mb in the text at every mention of it? Or better yet 128k and scrap the bits? Also why the use of bits and not bytes? Just curious.

Great work by the way I plan on getting one!

Tim

I see no ill intension (the practice to designate in bits seemed to be
common among console carts)... still, I do wish they would be consistent
with the common usage: capital "B" means bytes, small "b" means bits.
It's a little mixed up in the web page.

Tim,

Cartridges are always sold as mega-bits, even the newest cartridge based systems by Nintendo rate their ROM cartridges in mega-bits. Its always done that way because thats how ROM, RAM and other chip memory is sold, in megabits. Datasheets for EPROM, RAM or FLASH will always refer to the device capacity in megabits.

If it were a mass-storage device like a flash-card or a disk drive I would agree it should be stated in megaBYTES as is traditional for those devices.

I'm not sure what the motivation behind the 'i heard its only 128kb' posting is. He didnt have to 'hear' it anywhere, its not a secret I'm trying to keep hidden. The documentation, capacity and all the source code for the software kit was posted before the cartridge was even available for sale.

Hopefully those who dont understand will get it now with the additional clarification and changes to the order form. Anyone who feels they were somehow taken advantage or think they have made a mistake can return their items for a cheerful no questions asked refund.

Steve

ermm.. can't figuire out ADSR? hmm, I write synth-music, and know my ADSRs alright, as well as my ring-mod and rez-filters and LFOs and all that .. I just looked at the c-one page, and it mentioned several things such as filters and the like on the monster-SID, but this is all possible with a standard DAC anyhow, especially with a decent processor - they did it on the Spectrum 48k (tim follin et al) ;)

Thank you for pointing this out. I have gone in and corrected any 'mb'
or 'MB' notation in the documentation to read Mb.

Memory mapped vs. hardware I/O like IBM style maybe. Could mean color
encoded in the byte or color registers instead of bit planes.<If I remember
the terms correctly>

Again: Where did XE owners go? Where did C128 owners go? Where did
Sinclair owners go?

The only computer company to successfully make the transition from their
8-bit lines to their 16/32-bit lines, with any degree of compatibility
/at all/ was Acorn. And even then it was pretty kludged.

The II range had a longer run than /any/ 8-bit computer, it was the only
machine in 1991 that had a direct lineage to the 1977 originals. And
that was despite Apple's attempts not to just abandon it, but to
deliberately cripple it.

Call it SAM Mode 5 or SAM Super Mode 4. In 65536 colors.

> And at least is a Z80 based cpu :)

That is exactly what an eZ80 is. Get clever and you have a integrated
webserver as well. It is quite an awesome little chip.

I think it will serve just fine.

LisaOS had preemptive multitasking in 1983, something the Mac didn't
get until OS X, 18 years later.

Do you actually know anything about how such things are handled? The
*vast* majority of ISPs don't involve themselves in off-topic issues,
save for where abuse of the net (excessive BI counts, for instance)
occurs at the same time. (Many such abuses are - by virtue of the fact
that a large number of newsgroups are affected, in the case of cross-
posting and so on - coincident with off-topic problems, though not
necessarily so.)

Can we think why making decisions based on content might be a bad idea,
boys and girls?

Regardless of any confusion about the size of the cartridge... I think its great that you are selling these, and have released all the software as open-source. I'd buy one if my money wasn't so tight right now!

Exactly. I wasn't referring to the look-n-feel . I also mentioned up till
the NeXT since more or less it is an Apple Machine which in any case had
Preemptive multitasking (and the excellent Display postscript).

First, a warning:

***THIS IS NOT A FLAMEWAR!!!***

Trolls will be shot, stabed, gutted with a chainsaw, and forced to use windows for the rest of their miserable lives.

Ok, now the fun part.

While Basic is still my favorite os, I'm beginning to like OS-9. It's really cool. It can multi-task and support up to 4 users! On a little old CoCo 3!

I've read about several other os's that appear to have similar capabilities for similar machines.

Flex was available for the CoCo 1/2 long before OS-9, and it's latest version is called UNIFlex, that is, "Unix Flex".

There are several similar os's for the C= and other 6502-family computers, Including LUnix/LNG and OS/A65.

How many users will these other os's support? How many programs will they run? How fast or slow are they? OS-9's one real limit appears to be speed, but it's not that serious a problem exept when bit-banging.

Will the C=64/128 support a terminal on a Turbo-232? What about the Atari on the 850? How many? under what os?

I remember quite a few local BBSes in South Florida using trash 80s.
I used to be involved in a local 4 Cs club here and someone with a
TRS-80 used to attend. We always used to debate the differences
between the machines and he always mentioned the fact that he had some
type of ram expander that was something like 5+ megs.

You know my reply. On a trs-80...WHY?!?!?!

The TRS-80 color computer uses the motorola 6809 or the Hitachi 6803(or 6309
I can't remember) whichever, they're interchangable with the Hitachi being
slightly faster.

So did Vectrex and Dragon (hmm.. what's the relation between Tandy,
Radio Shack and Dragon, if there was one?). Neither of these systems
was manufactured by Commodore though.

What about the rainbow on the Sinclair Spectrum, or the colourful
keys on Enterprise 64 or Amstrad CPC464? Also, if gay is considered
to be different, the Forth-powered Jupiter Ace may qualify.

Yes, I am aware this is just another stupid troll, but I couldn't
refrain from commenting.

I think the Apple logo with the rainbow colors was the gayest logo back in those days. So that makes the Apple the gayest computer around. The C64 has rainbow colours too in its design so go figure. Why not change the term 'gay' to lame??? Using the term 'gay' is also lame.

Lord Teviolus sounds like a gay nick-name to me. R U gay? "Yes, i'm Lord Teviolus and i'm the gaylord of the 8-bit computers." Man, you suck!

Olaf.

Are you a computer fetishist? :-)

The computers themselves are completely a-sexual. They're neither
straight nor gay. They're rather like a perfect monk or non: they
never feel a desire to copulate.....

Humans are the ones who are gay or straight....

I'm not sure, because a computer doesn't have the capacity for sexual
orientation. Anyway, you seemed to have mentioned the word "gay" an awful
lot of times, don't you? I wonder what Freud would have made of that....

Hi,

A good port of OS-9 would be nice with extra memory support.

Uniflex I didn't know it could be interesting.

LUNIX LNG is the most interesting there should be a port for the 8-bit but only so it working in an emulator on the real machine it crashed. LUNIX has potentional and has real PPP/SLIP support, TELNET, FTP and more... Runs in 64Kb...

For the more advanced systems when you would have a 65816 with more memory the WINGS like the C64 is nice, very nice based on QNX.

TXG/MNX

Anyone like to port any of the OS systems above ?

Although they never copulate, a lot of Windows systems got *fucked* by the
LoveSan/MSblast worm.

When I funded my computer habits as a kid by working on a market stall
selling games, we would spot which customer went with which game. It
probably only works in the UK.

Commodore kids were always slightly overweight, usually dark haired.
They had round faces.

Spectrum kids were guite often ginger and freckled. Sega Master system
kids always were.

Atari ST owners were usually mid-teens and lanky.

Amiga owners looked like older C64 owners. Still round faced.

BBC games were /always/ bought by men in their 20s or 30s wearing
school-teacher looking outfits. Even the ones that didn't look like any
teachers at the local schools.

Electron games were bought by their kids.

I didn't fit the mould, but then, at that time I had a Jupiter ACE,
Enterprise 128, QL, MSX, TI99/4a, Mac, Lisa (MacXL, really), Acorn A3000
and a hell of a lot of other things ;)

>
There was almost nothing in common between Flex and uniFlex except
that TSC Inc wrote them both and the programming text editors were
pretty similar.

Flex (6800) and Flex-09 (6809) were both essentially CP/M clones:
Strictly single user and designed to run within the lower 56 K of the
68xx address space. They assumed a ROM monitor and peripherals
occupied the upper 8K. I used Flex-09 as my home system for some years
before moving to OS-9/68000 and still have the box in my loft. Typical
hardware was either an SS-50 bus system or and SBC like the Peripheral
Technology PT-6809.

uniFlex was a from-the-ground up sort of vaguely UNIX clone designed
to run on 6809 hardware that was fitted with some sort of MMU. It
assigned each user a virtual address space of up to 64K bytes that
held the OS system calls, the MMU and the user program. There was no
swapping: all user spaces and the OS had to fit into the available RAM
at once, though user spaces were increased and decreased dynamically
as needed.

>How many users will these other os's support? How many programs will
>they run? How fast or slow are they? OS-9's one real limit appears to

>be speed, but it's not that serious a problem exept when bit-banging.
>
It was supported by a number of manufacturers such as SWTPC, Helix, GIMIX and worked really well. I used it for a year or two. A 128 K RAM system would quite happily support 4 developers writing in the Sculptor 4GL. Typical RAM sizes ranged from 128KB to 512 KB though I suspect few had or needed more than 256KB. We sold the SWTPC systems to companies running high street plant hire operations: these people typically had 2 to 6 terminals on such a system, which took care of all their stock management and accounting needs.

The OS was efficient enough that almost all user interaction was limited by the (typically) 9600 baud terminal serial line speed. Apart from that you didn't notice other system users unless they had locked a record you wanted or a backup was running.

The main uniFlex problem (apart from terrible support from TSC) was that there was no standard 6809 MMU: every manufacturer used something different and the (non-modular) kernel had to be ported to each hardware range. Another major drawback was that the system was sufficiently different from UNIX that I never saw any standard UNIX tools ported to it. On the other hand, it did have DynaCalc, which was the second spreadsheet to be commercially available. Yes folks, it preceeded even Lotus 123, and referred to all the Visicalc tutorial material.

===

I used Flex-09 at home until OS-9/68000 (OSK) became available. A used a Gibbs UltraScience co-processor board in the back of a PC that ran OSK 2.3 for a few years before moving to a Peripheral Technologies 68020 system running OSK 2.4 in 8 MB RAM. This system is still used every day to run Sculptor database systems. Its dead reliable. I've run Sculptor systems supporting two busy terminals and several continuous background tasks with no performance problems at all apart from the occasional and inevitable record lock conflict.

It's being (slowly) phased out now in favour of Linux because the hardware is over 10 years old and unsupported and also because there's no TCP/IP stack for the PT port of OSK v2.4.

Again, speed is mainly limited by terminal bandwidth. PT's main console (/term) uses PC keyboard and graphics card and so is very fast, but other terminals attach by 9600 baud connections. My Wyse-120 is baud-rate limited, while Kermit-95 on this 300 MHz PC is very much CPU limited.

There surely was swapping -- in fact, one can't run UniFLEX without it. (I still have a couple of SWTPc S/09s running UniFLEX.) Sometimes it would cause problemms, such as when you had to re-install the system from the distribution floppy. One couldn't write protect the original floppy because the OS used it for swapping, and if something went wrong, the floppy was easily damaged. Not fun in those times, when one had to request a new floppy from overseas...

You're talking rubbish. Number of complaints != effectiveness of
complaint.

If it was that simple, I'd start up 100 throwaway web mail accounts and
ask your ISP to throw you off. After all, enough complaints and you'll
have your access removed!

Can we think why that might be a bad idea, boys and girls?

You really, really want to look into how this works before defecating
your nonsense all over Usenet. Your bizarre version of how things
should work in RossWorld doesn't coincide with reality.

I never saw it run on any system without a hard disk and, apart from
installation, we never attempted to boot off a floppy.

Its been about 20 years, but IIRC I read the technical descriptions of
task <-> memory mapping to mean that they were entirely the result of
modifying the few bytes of RAM that were part of the CPU -> physical
address translator for the top address bits and that no swapping took
place. I'm happy to hear that wasn't the whole story.

Well Commodore was founded by a Polish Jew. And the original Spectrum
was extremely black - it even had a snazzy rastafarian coloured
stripes in one corner. In which case, the blandly beige BBC was a
cardigan-wearing history teacher from Surbiton.

Message-ID: <_dt_a.644$Q5.268@fe01.atl2.webusenet.com>
Source record: 19759

Hello,

I am looking for release date MSRP price information on Atari computers released in the 1980's and early 1990's. I am trying to update my database to have that information available on my pages. Even if you don't have the entire price list, any price info on an individual computer would help too. Ideally, the prices should be MSRP with a release date. Example:

Computer: Atari 800XL
Price: 280.00
Currency: USD
Date: 1/1/1984
Market: North America

Any feedback would be greatly appreciated.

Krystian

We're working on scanning the book The Creative Atari by David Small for www.atariarchives.org and are wondering if anybody knows were to find any of the programs from the book. Many of the programs were printed earlier in Creative Computing magazine as well. If you have any programs from that book on disk, please let me know. Contact me at http://www.savetz.com/contact/

Thanks
Kevin

Just to get a bit more off topic, of course a perfect monk or nun would
feel a desire to copulate, he/she just wouldn't give in to the desire.
In antiquity castrates were not allowed to become monks AFAIK, I don't
know if this rule still stands.

The C64 was my first love concerning computers, and because I am
rather monogamous I donï¿½t have any comparison to other 8bit-systems
;-)

We run a gay diskotheque using a C64 for book-keeping and lighting
control. But from the fact that our guests in general donï¿½t pay much
attention to the system, I canï¿½t see any special affinity between
"gay" and "C64".

Why would anyone invest time in these stoneage systems like the ugly C64 , the even uglier ATARI 800 and the most ugly "mutated calculator", the Spectrum ?

Throw away this old crap and buy a PC or a Playstation 2 if you want to play !

Spend your money for modern stuff instead and invest in your economy instead of paying money for old crap hardware games,lots of money on ebay for worthless stuff greedy sellers bought for $0.01 on a flea-market.

Nostalgia makes no sense , these old computer-dinosaurs belong in a museum !

If all people would still use old systems,we would still use the ABACUS today !

The trouble with modern games is most of them are crap. Too much eye-candy
and virtually no playability.

> Spend your money for modern stuff instead and invest in your economy

Some of them are. Anyway how come emulators are so popular then, e.g.
MAME, Spectaculator, VICE? Answer: because most of the games still have
very good longevity and playability, something sadly lacking in most
modern PC and console games [1].

> If all people would still use old systems,we would still use the ABACUS
> today !

But a lot of people still use the abacus, because it's very fast and
accurate in the right hands. See China and Japan.

[1] Some Sony PSone games are very playable, this is why I keep one hooked
up to the PC monitor via a Gamars V-box.

OS/A65 and LUnix/LNG are both available for the C=64, so they will
work on the 6502.

> > Wasn't that the 65816?
> >
> Yes.

There is also the 65802, apparently a pin-compatible replacement for
the 6502 that was 8/16 bit. A 6502 version of the 6809?

> When the 6502 was pretty big, there was all kinds of speculation about

> of such coverage.

What!? They didn't know about the 65802? Or did it come out too late?
That happens. Or was it just not any good? That would supprise me.

> The only computer I can think of that had the 65816 was the Apple IIGS.
> And it came rather late, after the 16-bit IBM had been around for maybe
> as much as five years.

The CMD Super CPU for the C=64/128 has a 65816, and up to 16 megs ram.
I'm pretty happy with a 6809 and 512k, but the Apple IIc+ and C=SX-64
don't take much room, and I need a *good* portable.

Come on now, some of you Apple or Commodore people must know about
OS/A65 & LUnix/LNG. What can you tell us?

It's evident you were never involved with early personal computers.

I have much more fun playing the various c64 games I owned than 99% of the current pc games available.

Unreal II - The Awakening - Quake series - Half Life (latest version pending release soon), Doom III (Release TBA) , etc.

It's the same tiresome hash of 3d first person shooters. There seems to be a total lack of originality. I have seen a few exceptions. I thought "Oddworld" was great and there was a lot of replay value.

The 64, in my opinion, had some of the most talented artists, programmers, musicians, and they were able to do so much with the little resources the c64 offered.

I have games that occupy 50K that I think are MORE enjoyable than a particular game on my hd that occupies 2.3 gigs!!!

Bigger is not better when it comes to computers. If you're statements were true you would not have bothered to post your original message because there WOULD BE NO c64 newsgroup.

I know you struggle to understand why we enjoy our old 8 bits. I can only say I really have sympathy for you and its unfortunate you didn't have an opportunity to grow up with something like the c64.

I have about three boring beige boxes close to me. Nameless, boring, boxes. It's just not the same and you will never understand...

Ah, at least someone remembered that "gay" can also mean happy. I
thought the Apple // and C64 were very happy machines. Apple had all
those pretty multi-colored logos, and the C64 had TONS of arcade
games. ;-)

Becuase they like them. Why would anybody want to work on restoring
and maintaining vintage automobiles? For pretty much the same reason.
I bet you listen to music, and watch TV shows and movies
from your youth.

>Throw away this old crap and buy a PC or a Playstation 2 if you want
>to play !

We don't want to play, we want to play good, and the games we like.
Some are in it for the hardware, and to keep part of our popular
culture alive.

>Spend your money for modern stuff instead and invest in your economy
>instead of paying money for old crap hardware games,lots of money on

Some of us get the vintage stuff for free, or cheap at flea markets
and thrift stores.

>Nostalgia makes no sense , these old computer-dinosaurs belong in a

We need nostalgia to appreciate the modern, not just take it for
granted.

>If all people would still use old systems,we would still use the
>ABACUS today !

The people that have use the abacus in the far and recent past use
them now.

> What!? They didn't know about the 65802? Or did it come out too late?
> That happens. Or was it just not any good? That would supprise me.
>
We knew about the 6809 in mid-1979 for certain; there was that famous
series of articles in Byte that year. I cannot remember if that
was the first I'd heard of it, or if I'd seen an earlier article
in another magazine specific to the 6502.

My memory says that I didn't see anything about the 65816 till late
1981, when there was an article in Byte about it. I think the
fact that I can't remember exactly when I first heard of it is
an indication of how little impression it made on the computer world.

The CoCo was out in 1981 (or was it 1980?). By that time, there
were already big systems, like Gimix and SWTP, using the 6809,
in some pretty fancy systems. The Apple II 6809 cards had to
have arrived on the scene by 1981. I suspect the original Mac,
the one based on the 6809, was already in development at that point.

The 65816 definitely came late, though I obviously can't say
exactly when. Apple came out with the IIE and the IIC still
using the 6502, before coming out with the IIGS using the 65816
in 1986.

As I said, by that time, there were plenty of 16-bit systems around.
Indeed, almost as soon as the 6809 was around, there were 16-bit systems
to be had.

I don't think the 65816 got a chance, because it was simply too late.
But I suspect there may be something wrong with the design beyond that.
It's been too many years since I looked at it, but I thought there
was something that didn't work in it's favor compared to something like
the 68000.

Michael

Kid, shut up and learn. Quit arguing your points like a child. Your PC at these times can only do beeps and only had 1 color (green). The other was black. Also, alot of the PC games are hardly more than clones of each other. Lack of originality. As a matter of fact, it is essentially the same game with slightly different looking buildings and enemies but they look essentially the same. I really like to see more original games. There is 3 basic styles of how games are made these days for the most part. DOOM style but more color and higher resolution, the Final Fantasy X style game play, and 3d Simulation for Race Car games & Aircraft games. The first two is the most promidant. Some of the FRPG has more of a early Playstation style FRPG. This really isn't that diverse. Thinking about 16 Million colors. So what.

We all have enough money to buy decent PC's AND 8-bit computers AND 16-bit computers AND game consoles AND whatever else history there is.

Get a decent job that leaves you with money to burn, and then tell us again that we should invest in the economy.

Pauper.

I believe the IBM PC had CGA and the PCjr up to 16 colours in 1983, when
M.U.L.E. was released for Atari 8-bit and later the C64. Interestingly
enough, this troll didn't bother to post to MSX and NES groups, despite
it was later re-released on these platforms too.

But, as I wrote in a personal M.U.L.E. "review" elsewhere a few days ago;
one might have wished for a little more attractive graphics in 1983, as
I'm sure other games both on the Atari and C64 had evolved further by then.

> ugly graphics + cheap sound , nobody needs this crap

Not totally crap, just released too late, with no sensitivity to the existing market. It had a decent sized memory, some nice features and the promise of good software support. Unfortunately, the whole idea of having a bunch of different companies building to a 'standard' didn't work because they all added their own individual touches which immediately isolated them from the rest of the range. Plus, on its launch, MSX shunned the PCW show in London and did some fancy launch on the Med, hoping that hacks would flock to them to quaff on free booze. Sadly, the cynical old journos preferred the drizzle of Hammersmith and regarded the MSX contingent's attempt to do something different as a vile attempt to stand aloof from the rest of the market.

It's worth remembering that in 1983/84 everyone was paranoid about an invasion of cheap Japanese super-micros and had developed a kind of siege mentality long before the first Rising Sun appeared on the horizon. Consequently, when the MSX hit the beaches, the press drove it back into the sea in a frenzy of rabid patriotism. It also suffered, like the Amstrad CPC, by not being one of the early vanguard of 8-bit colour computers. Had it arrived alongside the Speccy, BBC and C64 it might have stood a chance, but 1984 was too late. Everyone was already in love with one of the 'big three' and knew that their next computer would probably be something a damn sight more powerful than the MSX.

Oddly enough, it proved popular in Brazil and in parts of Europe. It's also notable, of course, for being one of Bill Gate's early forays into global domination. His Microsoft Extended O/S ran on the thing - hence MSX. Here endeth the lesson.

Huh? The PC started out as (albeit crippled) 16-bit system from the very
beginning. Yes, the bus was 8-bit like, but the processor was internally
16 bit which made it easy to go for real 16 bit with the XT.

Ah, that's what I'm saying :).

> Oddly enough, it proved popular in Brazil and in parts of Europe.

It was pretty popular in The Netherlands, at least in the backward parts of
it. In the big cities people all had C64's and Atari 600/800's, but in the
rural part, people didn't catch on to the homecomputer bandwagon until the
MSX came out. Consequently, people in the big cities learned how to control
their computers, while people in the rural parts learned how to program
Basic and never got to understand how a computer works. They never caught up
with the rest :).

Aah... but we are not interested in the ugly C64 or Atari !!!

We are interested in the beautiful MSX system :)

The graphics are actually pretty good considering its age :)
As for sound... MSX had the possibility of hardware sound-cartridges, which
gave it about the best sound available at that time.

So far, none of your retarded comments are holding ground dude.
You'll have to find something new soon.

Or we're going to think of you as a major retard (if not already)

Interesting point of view, if utilizing vintage items instead of
buying new stuff is a way to passively support violence and terror.

Somehow it makes sense; on eBay there currently is a "C melody"
saxophone for sale, previously owned by the bandit Clyde Barrow.
The experts are not thrilled, but the starting price was outrageous.
Now I'm waiting for Mohammar Khadaffi's first Acorn Atom to be
auctioned as well. :-)

Now that's Microsoft for you. They ain't doing too well with the X-box
either.

Talking about consoles that didn't do too well, I got given
a Philips CDI-205 console last week, complete with about 20 games and plus
a couple of encyclopaedias. And yup most of the games on that are
absolutely shite, but it do have a reasonable version of Lemmings. Ah well
It's going in the 'museum' along with a Jaguar, Dreamcast and a 3DO.

BTW anyone remember Microsoft Bob??

Er... the contrary is probably true. Feeding the capitalist beast leads
to more difference between "poor" and "rich" countries, which is a sure
recipe for *more* violence and terror.
OTOH, giving our leaders more money to invest in weapons will result in
better wars with a lot of nice fireworks, leading to great TV shows and
the extinction of the human race, both of which are a good way to stop
violence and terror.

... #2 console in the world, beating Nintendo's Gamecube by millions of sold
units, the most growth of any console in years over the past year? I don't
see this as not doing well...

a quote from the web...

"According to EGM(as of 6/26) and some recent information from my inside
sources, I have discovered the following :

PS2: 51.2 million sold
XBOX: 13 million sold
GC: 9.4 million sold "

SO, therefore we find...

Nintendo, once the draconian, dictating, censoring leader of the console
market, has had:
(1) Ass trounced by newcomer Sony in 1996 ...
(2) Ass trounced by newcomer Microsoft in 2002 - 2003...

If any console maker is doing things wrong, its not Microsoft. Its
Nintendo. Rumors are Nintendo may never release another console, except
Gameboys... although those are only rumors.

Maybe people don't want "Mario's Animal Crossing Princess Kong Party 34587"
or "Mario, Wario, Donkey Kong and Luigi in SMB GoKart Golf 3302" ... all
delivered on a non-standard disc that is lost easily and hold far less
information than a standard DVD.

...then again when you market to the demographic of 3 to 8 year olds ...

I myself will be enjoying my Xbox with titles like Star Wars: Knights of the Old Republic... as well Star Wars: Clone Wars and Mech Assualt on XBOX Live.

RaYzor

I suspect the original question was from a Brit - in the UK the word gay is used by school kids to denote something uncool i.e. 'that new coat your mum bought you is so gay'

It's actually an American term. It originates in popular culture from
the usage by Cartman in South Park.

You are correct. It makes absolutely NO sense.

That is, to anyone who didnt play it when it was new and has fond memories
of it. Re-read your post in about 10 years (dont worry, it will still be
there)

I've been re-living the glory days of playing Ultima on my 800xl. One question though. I've searched all over looking for the answer.

How do you increase magic points? I can increase HP by the Mark of Kings. My wizard has over 1000 HP now. Not sure what to do.

TIA!

Thanks! Ideally, I'd like to know the MSRP on the first day the computer was available in the store, but this also helps a lot.

Anybody knows more?

Krystian

You know, Ben, you really should take some business classes and learn
better advertising. All you're doing here is pissing people
off...it's sort of like having popups on Usenet. Also, you really
need to take PayPal if you're running a web business. It's essential
these days.

Oh, your web site really could use a redesign too...perhaps an online
ordering system of some kind?

Honestly, these are only some of several reasons why I have not done
business with you in the past. If you stop/fix some of these things,
perhaps I (and others) will see you as a viable Atari source in the
future.

You know what's funny? When M.U.L.E. first came out, I used to think the same way that this troll does... what a dumb game, I'm never going to play that. But then years later, one of my friends showed me how to play it. We played that day for hours, and I was hooked. It is still one of my all time favorites.

That's what this is - a living museum. Without someone around that knows
a bit about these old machines they are just a pile of scrap. Users help
keep the remaining knowlege alive.

If you feel so negative about the old machines then you are probably not
old enough to have lived through what was probably the "golden age" of
home computers. I feel rather sorry for you...

Oh, and you're a troll as well. Go and play somewhere else.

The IBM PC was never an 8-bit machine. It had an 8-bit expansion bus, but
the 8088 was a 16-bit processor with an 8-bit data bus (like the 65816).
Later processors with a bus width less than the machine word size were the
386SX and 486SLC, which were 32-bit processors with 16-bit data buses.

From: Russ Gilbert <russg@en.com>
Message-ID: <vjnlmfsckvce07@corp.supernews.com>
Source record: 19833

I paid $300 for an 800XL in 12/83. Also $300 for a 1027 printer and $80 for a 1010 tape drive and $80 for Atariwriter #1. Somebody said $300 for a 400 in 12/83. That seems off to me, the 400 was issued in 1979, I think and would have been less, if it was still available.
I paid $325 for a double density Rana 1000 in about 4/84. Someone posted $125 for a 800XL in 12/84, that could be true, seems low to me. The FAQ has the dates of release of the computers.

In an attempt to bring this somewhat on-topic again; which computer,
chip or peripheral do you nominate as the most "castrated"? I don't
quite know, but my first thought is the 68008.

Have you been sailing into the whirlpool yet? I seem to recall this was
important in that you have to go there to find cards and advance at shrines.

The lame trolling attempt on your part aside, M.U.L.E. was a great game for its day and I still find replay value in it now from time to time (if I could only find the disk again!). In the early 1980s, we had no clue what computers would be like now 20 years later. Your flaming of M.U.L.E. would be like someone coming into the newsgroups 20 years from now and flaming a current game that you really like.

Oh yes, back in 1985, I was doing quite well with my Atari 600XL (expanded to 64K) and 127K 5.25" disk drive (model Atari 1050). Also, I even had a tape drive, model Atari 1010. Add to that an XM301 300 baud modem a year later.

Yes, the Cake-Box is doing pretty well against the GC, and although
they've sold less total units than the PS2, its sales may become
stronger (relatively) as the PS2 market gets saturated.

>

I myself will be enjoying the numerous great titles released on the PS2,
including the online stuff like SOCOM, GT4 etc. PS2 still has the
advantage of sheer volume of games.

Technically, the X-Box is probably superior to the PS2 in a lot of ways.
It took nearly 10 years for games programmers to take advantage of the
power of the 8-bit machines. I don't think anyone has really reached the
limit of the PS2 yet.

Richard

Apple IIgs. Easily capable of 8Mhz, Apple knocked it back to 2.8 so it
was slower than the monochrome and more expensive Mac SE...

The IBM PC, PC/XT, and similar computers based on the Intel 8088 microprocessor work with a 16-bit word size but use an 8-bit data bus. For this reason, they are sometimes considered one step above 8-bit machines and one step below 16-bit machines. However, generally such machines are called 8-bit machines because the size of the data bus limits the machine's overall speed.

Actually if it has the video extension (most CD-i except the first few
came bundled with that as I've heard) it can play all correctly authored
Video CDs (not Super Video CDs though). Sind Philips is Lord of CD
specifications, when they wrote the Video CD spec, they added the
requirement of a software player for CD-i machines, which has to be
included on any norms-compliant Video CD. I think CD-i itself was also
pushed as another "major worldwide CD standard", it was even licensed to
other companies, Philips just unfortunately forgot that stamping
"Standard" on something that is shite doesn't make it any less shite.

So you might keep it as a cheap DVD player replacement for the kids -
they won't be able to play (and ruin) your originals in it.

The only thing "16 bit" about the PC OR the XT was the internals of the
8088.

XT was no more 16 bit than the PC.

AT was 16 bit, including the 16 bit AT version of the ISA bus.

You're right about the 386Sx, butI'm nto so sure about the 486SLC. My
memory isn't too clear, but I thought the 486SLC was merely an enhanced
386DX.

And the fact that it had the 8 bit ISA bus.
The AT bus was 16 bit, but then one is talking about a true 16 bit chip:
80286

>ABACUS today !
>

Even in this modern day, with super-fast computers and highly capable calulators, the abacus is still used today, as is the slide-rule (a slide WHAT??? ;-) ).

My very first computer was an Atari 600XL. It was a Christmas gift from my father. I wore it out. Sadly I no longer have it. (Sniff, sniff)

I am an Atari junky, and currently am the proud owner of an XEGS, two 130XEs, three 800XLs, four 1050s, and an XF551 in a pear tree (no, not really; it's hooked to a 130XE at the moment). Oh, almost forgot about the 2600 (one day I get it working again; it was a victim of a misplaced foot that trashed the case and damaged the circuit board :-( ) and the zillion carts for it.

I did have a 5200 once, and played the hell out of it. I loaned it to my brother one day years back, and as fate had it, his house burned down, and so went bye-bye my 5200. Sniff, sniff...sob....bwaaaaaaaaaahhhhhhhhhhhhhhh!!!!!!!!!!

(wiping tears from eyes and typing on....)

I currently have one of the 130XEs set up, hooked to the 551 mentioned aboved, with the rest of the hardware safely packed away as spares. And yes, I do indeed fire it up every now and then to play Ballblazer or PacMan, or dabble with the Assembler/Editor, or play with Adventure Creator. NOTHING beats the actual hardware.

(BTW, I do use emulators: Atari800Win+, PCAE (2600 emulator), Jnes (NES 8-bit emulator), and SIO2PC floppy emulator.)

As mentioned in another thread, the games today do not have the playability that the old games have. (My wife loves the hell out of PacMan, Ms. PacMan, Q*Bert, and Frogger. She doesn't care much for today's PC games. I won't mention her beloved Mario, as it is not a PC game, per se.) I've played Half-Life and Homeworld, and after beating them, they pretty much lost their appeal. But I still play the "oldies" regularly.

Now go find your rattle and plug your strained-peas hole with your pacifier.

RoyalHeart

A thoughtful pause, then resumes the prince, "Thou hast to learn from Yesterday, but live for Today, and look forward to Tomorrow, for The Past be The Present, and no less The Future."

The 6809 as used in the TI-99. It had a nice architecture, but ran far too slowly.

486SLC was a Cyrix processor that emulated the 386 but was supposed to have
486SX performance.

Regarding 386sx you are absolutely right... that was however IIRC the last
time Intel employed that technique as the 486SX just lacked the FPU (or
according to other well informed sources... they were just damaged during
production and rebadged ;-) Of course their FPUs were full fledged 486DXs
;-)

Well...BASIC is, strictly speaking, a programming language, not an operating system. It does provide an abstraction of some computer facilities, but not very many (most notably there's no notion of a process), and no facility for extension.

> I've read about several other os's that appear to have similar

UniFLEX was indeed written by TSC (Technical Systems Consultants), the people who wrote FLEX, but I'm not sure how compatible it was. I do know that it insisted on having memory mapping hardware (i.e. there was no equivalent of OS-9/6809 Level One).

> How many users will these other os's support? How many programs will

Any computer that has I/O hardware that gratuitously chews CPU cycles in order to cut corners will have response time problems.

James Jones

On the other hand, the BASIC prompt is where you do all the program
launching and device interaction on all Commodore 8-bits, for example.

And, of other operating systems, DOS doesn't have much of a concept of a
process either (however, DOS isn't much of an OS ;-).

## 4695. Atari console emulators and games

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-15 04:39:33 UTC
From: "M. Pender" <mpender@hotmail.com>
Message-ID: <9uZ_a.11974$aW3.2630@nwrddc02.gnilink.net>
Source record: 19707

I'm looking for a good console emulator for the Atari game consoles that runs on a PC and a source for the older games (Pitfall!, Yar's revenge, etc.).

I've found a lot of executables at UMich, but I don't know where within the site to look for the older generation of console games, or whether there is a better site elsewhere.

Also, I'm assuming that most of those old games have become 'abandonware' by this point, I'm not trying to encourage piracy (it hardly needs any encouragement).

> could only find the disk again!). In the early 1980s, we had no clue what
> computers would be like now 20 years later.

You said it....(see below)

> Oh yes, back in 1985, I was doing quite well with my Atari 600XL (expanded
> to 64K) and 127K 5.25" disk drive (model Atari 1050).

heh ...I still remember thinking with my Atari 1040ST, "Why would anything
need
more than a megabyte of memory??". Pretty funny now that I think about it,
as my current
project passes the 13 MB mark in total (compiled) size, and it's only about
70% done.
A piece of music in the game takes up more room than all of the memory in
what I thought was a ridiculously high amount in that 1040ST. Funny. ;-)

By Atari console, and the game references I take it you are looking for an
Atar 2600 emulator. This is the atari 8-bit computer newsgroup... wrong
place.

I believe their are several 2600 emulators out there, but I don't know much
about them, not even their names. I recall something like, "Stella" maybe?

I'd recommend z26. There are DOS and Windows versions, and it's the most
true emulation I've seen. http://www.whimsey.com/z26/z26.html

For older game images, check out http://www.atariland.com. They have a
free registration that even includes an email account.

Kindasorta. They come with an MS-DOS-type OS partly in ROM, and
partly on disk; the MSX-DOS on disk implements a CP/M-80 2.2 API (but
the look and feel is, essentially, MS-DOS 1.25, and disks are FAT-12).

I remember some people calling them 12-bit CPUs, since they were 'half
way' between an 8-bit and a 16-bit :o) I've never considered them to be
a 8-bit CPU, since from a programmer's perspective there is zero
difference between the 8088 and 8086 except for the performance. Indeed,
what does the width of the external memory bus matter? If a CPU used a
serial bus no one would consider it a '1-bit processor'. Conversely,
some of the modern CPUs have had 64-bit external memory buses for years,
but they're still only considered to be 32-bit CPUs.

Hi,

> Dammit, I use a VGA montior that only supports 640x480x60/72 or 800x600x60

> For some reason when I run the exe it is choosing a video mode that's
> causing a sync problem on my 38" RCA monitor...

Actually, it's more or less up to the SDL to choose the VideoMode for
me, but you can do something against it. Use an editor (the windows text
editor will do fine) and create & open the file ".atari++.conf" right
in the directory where you put the executable. Add the following two
lines to the file:

PixelWidth = 2
PixelHeight = 2

This instructs the emulator to magnify pixels a bit, hopefully
enforcing it to use a different screen resolution. Once you get the
configuration menu on the screen, you're able to adjust these settings
to your needs, of course. You'd might try to use higher values for
the magnifiers, up to 4x4 maybe, though it just gets slower then (and not
necessarely better). Try the smallest number your monitor still tolerates.
For me, 1x1 works, but 2x2 looks slightly better without hitting
performance too much.

BTW, thanks for the note. I need feedback like this to get the emulator
better. Please let me note whether 2x2 works better for you, and if it
does, I'll change the defaults for the next release and add a note to
the manual.

Greetings,
Thomas

Sorry, being gay is not a choice. And I'm gay, so I should know. It's no different from being left- or right-handed, for example, and I don't see anyone banging on about how left-handed people have chosen to write that way.

But more importantly, what's any of this got to do with the Spectrum?

A modern Pentium III running plain 16-bit MS-DOS from a floppy only
would be a good candidate..... :-)

Or what about a modern Pentium III running an Apple II emulator?
Those emulators are really pieces of "lobotomy software".... :-)))))

OTOH if being gay is purely in the genes, why are people gay at all?
I mean, since gay people don't get biological children for obvious
reasons, those genes ought to have become extinct long long ago.
True, today we can inseminate -- but that's a quite recent invention,
and the gay genes ought to have become extinct long before that.

Yup this CDI I got, do have the MPEG video cart fitted. The friend who
gave it to me was telling me how much he paid for it in the first place.
Something like ï¿½450 for the basic console and ï¿½150 for the optional
video cart in 1993 when he bought it new.

> Sind Philips is Lord of CD
> specifications, when they wrote the Video CD spec, they added the

> "Standard" on something that is shite doesn't make it any less shite.

I happen to have a couple of video-CDs in the collection (Moonraker and
Star Trek: The Motion Picture), which do play on the CDI.

I think where Philips cocked up with the CDI was their marketing. They
where trying to market it as a multi-media 'educational' console rather
than a straight games console, judging by at some of the titles that
came with this CDI. It's got 'Compton's interactive encyclopaedia',
Treasures of the Smithsonian, 'The Smithsonian presents, Stamps, Windows
on the world', 'Rand McNally's America', 'Interactive cruise directory
1994' the sort of stuff you're unlikely to see on a SNES, Megadrive, or
Playstation.

As for the games I got 'Battleships', 'Connect4', 'BackGammon', 'Ceasars
Palace, World of gambling', etc.

In fact out of the 20 CDs that came with it, only two are my type of
game/app: 'Micro-machines' and 'Lemmings'.

> So you might keep it as a cheap DVD player replacement for the kids -
> they won't be able to play (and ruin) your originals in it.

I don't have any kids myself. And I already have two DVD players (one on the main TV and one in the bedroom).

I wonder if the CDI has any hacking potential?

A method of self-regulation for over-population? Another theory is based
on some tribes where there are 'gay uncles' who look after the kids whilst
the dad is out hunting and mum is doing her bit. Could be any number of
reasons really.

It wasn't compatible with FLEX in any respect. However, TSC made a
(somewhat limited) version of FLEX that ran as a task under UniFLEX.

[...]
> Any computer that has I/O hardware that gratuitously chews CPU cycles in

Exactly, that's the weakest point of both OS9/6809 and UniFLEX/6809.
Both SWTPc and GMX developed IIOPs (Intelligent I/O Processors) that
made wonders with performance in that respect, but at that time the
"8-bit era" was about over.

TI99s don't use 6809s. They use a TMS9900 - 16-bit - CPU.

Intel's 386sx would also come under that catagory, 32bit processor
castrated with a 16bit data-bus.

TI-99 had a TMS9900 in it, a 16bit processor. 6809 was used AFAIK in the
Dragon 32/64 and the TRS80 CoCo.

And the Vectrex, which someone who wants bitmap graphics could call
castrated as it works with vectors instead of a traditional bitmap.

>8-bit machines because the size of the data bus limits the machine's overall
>speed.

I've never heard _anybody_ call them 8-bit machines. That my PC/XT is about
as sluggish as my unaccelerated IIe (maybe even more so) is irrelevant. If
the IBM PC and PC/XT are "8-bit machines" on account of the width of the
expansion bus and/or processor data bus, then the TI-99/4A (connection to
the PEB is 8-bit) and Apple IIGS (same expansion bus as other IIs) must also
be 8-bit machines. I think you'll find that more than a few people
(including me) would object to those characterizations.

As somebody else posted, it's the programming model presented by the
processor that's relevant. The 6502, 6800, 8080, etc. provided a few 8-bit
registers, so you were limited to working with 8 bits at a time. The 8088,
9900, and 65816 offered 16-bit registers and let you work with twice as much
data at once as the 8-bit registers. That the 8088 and 65816 used two reads
on an 8-bit bus to fill a register is irrelevant...it might be a bit slower
than reading 16 bits at once, but it doesn't change how your code works.
(The 65816 even used the data bus to latch the upper 8 bits of a 24-bit
address into an external register; it's how the '816 was shoehorned into a
40-pin package not much different from the 6502.)

Message-ID: <3f3d0383$0$16184$2c56edd9@news.cablerocket.com>
Source record: 19738

When you power on a 1050, it checks the operation of the 6532 chip. If it fails, the select light just blinks (it is checking over and over...). Once it thinks that the main chips are OK, the drive seeks (steps) to track 0 by moving the head back until the track 0 sensor is active. If the track 0 sensor does not see the flag after 40 or 50 steps, the 1050 dies. If your drive moves the head, it probably passed the logic tests. If the head moves but the drive will not run, it is probably the track 0 sensor. It is a little, black, U-shaped gadget mounted at the back of the head carriage. They go bad all the time.

Nope...I had one a few years back, and it was pin-compatible (more or less)
with the 386SX (and had the same 16-meg memory limit as the 386SX as a
result). There was also a 486DLC that had the same kind of compatibility
with the 386DX.

Not necessarily... by the same logic, genes that result in fatal birth defects should also be self-limiting, but there is ample evidence to the contrary. Presumably the "gay gene" would be a recessive.
Also, it is not that uncommon for folks to "come out" after marrying and begetting young, thus propagating said genes.

In the case of 8-bit computers, however, I would say that choosing to be gay is simply out of the question... it's all down to programming.

The 99/4A (and 99/4 before it) used the 9900, not the 6809...it was the
somewhat bastardized architecture of the computer (with the first 16K of
memory accessed by sending commands to the graphics controller, instead of
putting the memory on the processor's data bus like everybody else) that
made TI BASIC so slow. (Programs running in expansion-box memory are
supposed to be a fair bit faster...I haven't had much chance to try it out
for myself since getting a fully-loaded 99/4A setup a year or so ago, and
the one I had in the '80s was just a basic setup.)

Same for the 8088. But a better example of castration would be the
486sx, in which the FPU was present but disabled (possibly because it
failed thhe test as a regular 486, possibly deliberately; it varied from
chip to chip).

There have been machines that implemented multibit cpus with a 1 bit
unit that serially worked it's way through the word. I believe some of
the 12 bit PDP-8's did this.

I used to think of the 8088 as an 8-bit processor with a few extra bells and whistles from the hardware perspective, but originally my comment was only directed toward the fact that the PC did a very successful job of maintaining software compatibility through the 8088/8086/80286/80386/80486/Pentium.

The TI-99 4/a was a 16-bit processor but it was tied to the program storage memory (video memory) in a bizarre configuration that only allowed the

processor direct access to some 256 bytes of scratchpad memory.

Changing the time required to perform instructions as a function of the machine architecture *inherently* changes how code works. Timing critical code had to be written so it would take the same time whether the first word of a pair of parameters was on an odd word boundary or an even word boundary when a 16-bit data bus was used, vis the 8-bit data bus of the 8088. That's a HUGE difference.

>defects should also be self-limiting, but there is ample evidence to the
>contrary.

They are self-limiting. But not self-eliminating. Sometimes there's
a heterozygote advantage. Sometimes the gene is a common mutation
(and is thus often created anew). Sometimes it just happens to be
near a gene which confers a survival advantage. There's probably
other mechanisms.

With a hypothetical "gay gene" or set of genes, I'd bet on
heterozygote advanatge. Just enough, and you get a stylish
heterosexual guy who knows how to impress the ladies. Too much, and
you get a guy who knows how to impress the ladies but has no use for
doing so... just another of the world's ironies.

nb: I'm only half serious.

You might want to include the .atari++.conf file in the zip archive.

If you run the emulator on Windows and that file is missing, any time
you press a button the whole thing silently just shuts down.

Eventually I tried saving a configuration file, then the emulator
started to work.

BTW is the 1.26 source code available, and what tools are required
to build it on Windows?

Only on Atari ST, not the 8-bits. On the 8-bits there was a Pirates of the Barbary Coast.

Tried to no avail....maybe I need a valid config file to edit?

Also I noticed your filename was .atari++.conf it seems I can't create a filename beginning with .

Someone email me a valid atari++.conf file....thanks.

Hi,
I had a hard time also. But I finally got something to work between program closures, and this is the results: The program will eventually make a config file-- '.atari++.conf' -- I think as soon as I got the machine type and location of proper rom the program wrote this file to the directory. Good luck I like the interface it is a lot like the emulator for DOS interface. Be sure to use the scroll bars to expose all options.

Those who do so are not 100% gay -- they're bi-sexual. Otherwise, if
they felt forced to marry due to pressure from society, it would have
been a white marriage - and such a marriage does not produce children.

# 4737. 800Xl and 1050 with US Doubler for sale

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-15 20:13:50 UTC
From: RED <redodd@comcast.net>
Message-ID: <T16dnapQOotko6CiXTWJjQ@comcast.com>
Source record: 19650

Hello,

I have for sale the following items. I am asking $60.00 plus shipping. Atari 800XL, 1050 Disk Drive with US Doubler and original Spartados Construction Set manual, 1 really good Atari Joystick and all cables and power adaptors. Included are the 2 original Spartados disks and the following versions of Dos: Dos 2, 2.5, 3, 4, Superdos 5.1, MyDos 4.53/4, Dos II Double Density Densxl with 7/82 Compute fix, Fast Double Density Dos II, Smart Dos, David Young Dos with Superdup and Fast Write, Dos XL Ver 2.30. Also included are the Atari Translator Disks "A" and "B". Games included on disk are Joust, MsPacman, Super Pacman, Jungle Hunt, Donkey Jr. & Sr., Spy Hunter, Centipede, Missile Command, Crystal Castles, Pitstop, Q*Bert, Pole Position, Gyress, Pengo, Rally Sppedway, The Blue Max, Kangaroo, B.C.'s Quest for Tires, Defender, Frogger, Capture the Flag, Kaboom, Seawolf II, Berzerk, Star Crystals, and last but not least, Trax Lair. All software are copies except the Sparta Dos disks. System works great. I haven't packed it up and weighed the box yet but if you are interested, I will give you shipping estimates for USPS. If no one responds in a week or so, this will be put this on eBay. Thanks for looking. I'm located in Fairfield N.J., zip 07004 so you can pick this up if you want.

Ralph

That doesn't mean that it wasn't.

Some haven't heard the 68000 called a 32 bit chip.

At the time of it's release, the PC was called a 16 chip machine, but
the 386SX was called a 16 bit chip as opposed to the 32 bit 386(DX).
Only after "true" 16 bit chips and buses where used (AT and later) was
the PC referred to as an 8 bit machine.

That my PC/XT is about
> as sluggish as my unaccelerated IIe (maybe even more so) is irrelevant. If

> (including me) would object to those characterizations.

And yet the TI 99/4a was lumped with 8 bit machines like the Apple II.
The only thing "16 bit" about the //gs is the internal registers of the
65816 in native mode.

>

Because it was 8 bit, as opposed to a "true" 16 bit machine.

but it doesn't change how your code works.

Well, there are two ways of looking at it: software perspective, or
hardware. Woz wrote Sweet16, and the II also ran UCSD Pascal, so I
suppose you could call the II a 16 bit machine....

# 4741. Atari++ Windows bug?

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-15 21:20:15 UTC
From: LionOfJudah <bcozier@bellsouth.net>
Message-ID: <R0c%a.168$mE5.129@fe05.atl2.webusenet.com>
Source record: 19654

Ok I got the config file to work.

Now....when I am trying to run ANY machine type with atari basic rom... I can execute commands at the ready prompt but when I try to enter a propgram like :

10 ? "HELLO"

as soon as I hit enter, the whole program bombs and puts me back into desktop.

Maybe my ATARIBAS.ROM file is bad?

When I use the XE machine type with the BASIC XE cart I can enter programs ok.

Now...another problem seems to be that I got mydos 4.5 to work ok..but it appears that my SMARTDOS isn't working. It will boot ok and go to basic XE but when I type DOS, it bombs and goes back to desktop....also if I try to boot SMARTDOS without any BASIC same thing.

I just checked it with Atari 800 WIN Plus 3.1 and I can enter the same line
ok with the ataribas.rom file ....looks like a problem with Atari++ but
basic XE works just fine.

I can finally play Stargate! It messes up on Atari 800 Win 3.1....

Only thing is I can't use SMARTDOS....or regular Atari Basic yet....

LOL, I know what you mean! I actually got a 520ST myself back in 1987 and I think I might still have the original receipt for it. The "wow" factor was quite something at that point in time, especially with regards to the memory! I have good memories of the 520ST but I do recall the floppy drives as being high priced and less than stellar and that the color monitor was insanely expensive. It was selling for $600 Canadian and I never did buy one. I did, however, get the monochrome monitor and it was pretty good. The first game I got for the ST was Star Raiders. Later I got into Roadwar 2000 and Roadwar Europa, and the Phantasie games.

That was a good trip down memory lane, thanks for that.

I like the PIII running DOS. What about a PIII with a dos mode web
browser (DosLynx386 2.8.2R1) and a MS workgroups for Dos network server?
The TCP/IP support for Lynx is handled by WATTCP running over a crynware
packet driver shim on top of Microsoft real mode netbios, coexisting with
the netbeui for the server.

It works, you can search google from it, download a file and even share
the download directory and read the file from a windows PC but its a real
ballless wonder and about as stable as an elephant on a unicycle. (I had
a slow week at work once and set it all up for a laugh)

Lynx isnt actually that bad. Win32 Lynx is a decent plain text web
browser and will fit on a floppy if you trim the help files. Can be
useful sometimes to have a private web browser sometimes that doesnt leave
footprints everywhere through the system.

Well, my Atari 800 is actually older than I am (born in '81). I replaced my 800 with a 130XE, but I still have the 800. I first started programming at about the age of 8, and by then the 8-bit was on it's way out the door. But, even so, I cabbaged onto every resource manual, book, article, whatever I could find that was 8-bit related and havn't let go of it yet.

Long live the Atari 8-bit! Long live all the old computers! They all rocked. (this coming from a person who barely remembers the 80's...)

Oh, yeah, BTW: We had C64 and C128 machines at my school for YEARS. We still had them when I graduated, and, oddly enough, no one ever complained about "the crappy computers". Most of the people that I went to school with were like "Oh! Cool! A C64! I have one at home".

Ouch, I really hope Dani Buten does not hear this wherever she is now :-(
Man you really are an ignorant, this game basically set the standards for
strategy games 20 years ago out of nowhere. It basically invented the basic
mechanisms, while most games nowadays are just clones of each other this
game was a strike of a genious, there basically was nothing you could copy
when this game was created. To ignore this basically just means you simply
are an idiot not even worth touching the works of Dani Bunten.
(I still can remember seven cities of gold and how far advanced it was for
its time, the first game which came close and maybe surpassed it in this
genre was civilization, but seven cities of gold has to be rated much
higher in my opinion due to the fact that it basically was the first game
of its kind on the computer, besides that a technical masterpiece given the
limits of early eighties computer technolgy.

# 4757. Question about disk drives

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-16 22:04:56 UTC
From: ravuya@NOSPAM.PLEASE.icarusindie.com
Message-ID: <ravuya-1608031605590001@192.168.1.104>
Source record: 19670

Hey,

Just picked up an 800XL from a nearby flea market. This is my first Atari system, so yay for me. The system works great; I got a 1050 disk drive along with the unit and a couple of (copied) disks.

My question is, how would I be able to take an atari disk image (.ATR or whatever, I guess) and write it to a disk? I've got an old 5.25 floppy drive kicking around for my PC; dunno how powerful or what the hell I need. Can I use any floppy? And if so, how do I copy them over? I'm running Linux but I'm not above running a lil' bit of Windows if that's what the copier app needs.

Also, some of the disks that came with the thing aren't quite loading up right; most of them give me a boot error on startup or won't load fully (lock up on black screen, or toss me to the system shell where my keyboard won't respond and there's no "READY"). Am I using the wrong way to load the disks? I found that turning the Atari and disk drive off, then turning the disk drive on while empty, then loading the disk in, waiting for the light to come off, and then powering the Atari up seems to work. Is there a better way? It shipped with a copy of DOS 2.5 but the disk is either fried or I'm loading it funny.

Thanks for the help guys. Looking forward to many happy times with this new box.

- rav

The real question is: Which type is your ROM file, which BASIC ROM file?

Yes, that really works fine here, I would have found such an obvious
bug. (-; Did you use an XL ROM for the "XL"? Note that the ++ defaults
to the Atari800XL, not to the 800.

> When I use the XE machine type with the BASIC XE cart I can enter programs

No, nothing like that here, sorry, I've currently SmartDos running in
the emulator next to mozilla.

However, there's one thing you can always do: Pack your configuration
(.atari++.conf), the ROM files and the problematic disk archives into a
.zip, and mail it over. It case there is a bug - nobody is perfect - it
is much easier to fix it this way. You should have my mail, shouldn't you?

So long,
Thomas

> You might want to include the .atari++.conf file in the zip archive.

Actually, the default configuration should be rather setup in a way that
pleases most users. Which means that if it doesn't please you, write me
a note (as happened above). I'll change then defaults for the next release.

> If you run the emulator on Windows and that file is missing, any time
> you press a button the whole thing silently just shuts down.

Why? Not that I'm aware of. I'll see whether this happens, but the
config file itself is rather unimportant. It's not strictly required and
rather a convenience feature. Or at least it should be.. (-;

Ok. I'll check this out.

> Eventually I tried saving a configuration file, then the emulator
> started to work.
>
> BTW is the 1.26 source code available, and what tools are required
> to build it on Windows?

The sources are available right at the same place where the emulator is,
namely at my home page:

www.math.tu-berlin.de/~thor/atari++

There, get the .tgz file. These are *also* the sources for the win32
version. Read the Compile.win file, it contains the steps required to
build the emulator for the M$ world.

For Linux, you'd need a g++ (2.95.3 or better). For win, you'd need
Visual Studio .Net 2003, or rather the Visual Studio 7.1 that is part of
it. The VS 6.0 is far too buggy to be useful.

You also need the SDL development files, IIRC at www.libsdl.org.
I just see that I forgot to include the resource and icon files for this
time, but everything else should be there, including the project settings.

Greetings,
Thomas

With some disks, you might need to hold the Option key down while
booting. With the DOS 2.5 disk, if it gets to a READY prompt with no
errors, try typing DOS.

You need an sio2pc interface. It will allow you to use
"atr" files on your PC hard drive. You can get them at
Sunmark. http://www.sunmark.com

Besides, the question (at least in my case) is not whether to use an apple II or a PC, but whether to use the Apple II ($17 for 128 k IIe with SSC, duodisk, and monitor) or a Basic Stamp II starter kit ($140, 2 K of Rom, 32 bytes ram.)

I can get the Apple II AND Vernier's Better Mousetrap book, and the parts for a project or two for half of the cost of the Basic Stamp set up.

On a related note, I've tried to build an IO card, but I haven't yet made one that worked. I'm doing something wrong in the bus interfacing line. If any of the card wizzes out there could come up wit a digital IO card, or an A/D card, or a D/A card that worked, I would probably buy it. I should have bought the Applied Engineering cards when they were available. What happened to those designs anyway. Who owns them now?

Grump Grump.

Lynx 0wnz j00. :-) Under Linux, I'll use it in shell scripts that need to
"scrape" info off a website...lynx -dump http://whatever (replace -dump with
- -source if you want to work with HTML instead of text), and then pipe that
into grep or awk or sed or whatever to extract the info I need. It's also
good for leeching files off of websites/FTP sites...put it under control of
a script for that.

# 4765. Re: Full Motion video on ATARI again

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-17 04:11:44 UTC
From: 1
Message-ID: <3f3efa17$0$13106$a04e5680@nnrp.fuse.net>
Source record: 19678

I once put a WD65c816 in my atari 400, the atari has the cpu on a card with two bus buffers and something else. i forget what. its been 8 years...

the 400's CPU card is the same as the 800's card, i believe, anyway..

THE 65816 is a 16 bit version of the 6502, in case you din't know, it only ever made it to the
Apple IIGS computer, which stood for graphics and sound.

This processor had Extra registers, and Extra Instructions, one of which is the MOVE instruction.. This can move memory around automatically, and only take 7 machine cycles per byte. the Atari's clock being one half of the color TV colorburst crystal freq gives us a clock of 1.789790 MHz for the Atari.

If one were to use an '816 processor coupled with an Mpeg decoder and a special paged memory address expansion, one could get the '816 to move memory from the Mpeg card to the display list's data area..... all tons of hard work and would result in

1.789790 mhz / 7 clock cycles = 255684 bytes moved a second.

255684 / 320 / 192 = 4.16 frames per second
255684 / 320 / 160 = 4.99 frames pers second

It would be best if one could run the processor at maximum speed with it's own ram, in a separate address space from the rest of the computer, and have delayed writes buffered to the rest of the computer, reads from the rest of the computer would be the a cause for halting the clock to synchronously write, and one would also have to allow the C/GTIA / Antic to access the remaining 'built' in memory of the rest of the computer as normal, or at least very normal.

higher speed memory with an interleaved access would also be a good thing, instead of having to allow for delayed reads, and buffered writes. The '816 can run much faster than the almost 2 megahertz of the Atari. I dont recall the Apple II gs' clock speed, but the Apple II's clock was only 1 megahertz ( or very slightly higher, 1.012 or something like that...)

The software required to control the Mpeg card is another thing to consider, imagine getting a windows driver for one, or even a dos driver and then having to issue all those commands to the Pc card's bus..

PC processors, ie Intel chips have a very odd memory structure. There is conventional memory ( ie Ram, ROM, etc) and there are I/O ports, both of which reside on separate planes of existence in the mind of both the Processor itself and that of the Assembler program writers'.

Separate machine language instructions access RAM and ROM versus accessing the I/O port address structure, which DO share the Address bus, but are separated once they leave the processor, I believe. Somewhat similar is the confusing way ( at least in the older ) Intel chips have a multiplexed Lower Address, and Data bus, a way to make chips have fewer leads, a money saving ploy.

If you succeed in full motion video on the 8 bit atari, without cheating, that is actually Using the Antic / Ctia/Gtia and the processor running the computer to control the MPG decoder card, you deserve at least an honorary degree in electrical engineering / computer science or a MacArthur Grant - which you may use to study how 16,777,216 networked Timex sinclair ZX81's can be used to forecast rainfall in the near future.... ( hmm, if they are all wet, it's raining. If only some of them are wet, it's scattered showers, If some of them are under water and the rest are sparkling and burning, it's both High tide and time to move your research facilities further inland on your little deserted island.

I have connected a PC keyboard to an Atari, and had to use a two 8 bit shift registers to read from it, as PC keyboards have a 9 bit map code, with separate codes for "press" and "release". The atari's 5 volt serial bus could have been used to read from it, but it being at most 8 bits was a hindrance so i did not even attempt it, as writing a properly working driver would have no way to know the difference between a press and a release.

It was fun to do, but as part of a project to add more and more PC hardware, it seemed pointless to becoming a replacement for actually buying a PC. I also added a BUS mouse, and had a driver working transparently to any language or lack of language installed, with a mouse moving automatically on the screen, using vertical blank interrupts to poll the bus mouse's inputs. A simple peek or three could read the X ( hi and lo values) and the Y value, and this allowed Basic, BasicXL, or figForth or deepblueC or whatever to be able to have input from the mouse as far and x and y, the mouse buttons becoming the joystick fire button and the other mouse buttons becoming Paddle inputs. Once done, the rest became part of the area of application software, which I was not into. Drivers and hardware were my area. Once a few tests were done, it was archived. I could have had a magazine article or two, but I was a few years too late to do that. One time tho in high school, I traded a casio thermal ribbon graphic typewriter and some cash for a Votrax voice box for the atari ( worked over the SIO bus and played thru TV sound output). The guy I traded with was a Ravi subramanyan, i think, i recall, and he later wrote an article with some information i provided to him about a Parallel Printer interface for the Atari, using two joystick connectors as outputs, and having transistors adapt the output for driving the somewhat long cables these use, the transistors being necessary also as the joystick connectors had pull up resistors and capacitors on them to debounce the input coming from the joysticks, which are fine and dandy, but make horrible outputs unless one either clips these pull up resistors and capacitors or uses transistors to drive the desired outputs to saturation again, which is necessary to drive a cable for a printer..... I didnt get credit. i was in high school and ravi was a college student at

Vanderbilt University. this was about 1981 or 3

hofacker ( or hofacher?) hackbook for atari was also a place one could find hardware / software things.. I lent mine out, I would like another copy of it.

Sorry, yes, I meant the TMS9900. And specifically, its use in the TI99 home
computers - a 16-bit CPU hobbled by the TI99's 8-bit system architecture.

Fraid not Thomas,

Without a conf file being created by the user it won't save settings
like OS paths and does a rather hasty shutdown when one is chosen.
Infact without a conf made by the user you can't run a game or get the
agreement screen :-)

Still, looking good..

Hopefully James and yourself can add drive selector boxes and zip
support once more important issues are ironed out :-)

Navigating diff drives with F:\\ E:\\ etc is damn hard work (I'm
joking)

Let's not forget the M.U.L.E. theme song - it's STILL burned into my brain.

By the way, what was your favorite character to play? I chose Humanoid - I liked a challenge :) I usually took that race that loved farming, too - and I cornered the market on the river.

Ok I emailed my SMARTDOS.ATR image just to see if you can get it to boot into the menu. If you can, that will confirm I may have bad OS roms or something...although they work ok on Atari 800 Win Plus.

I've to see whether I can get a win version of the ZLib. If so, then
that should be an easy going. On Linux, that's not a problem, .gz
support is compiled in.

> Navigating diff drives with F:\\ E:\\ etc is damn hard work (I'm

Actually, I do have an Atari 400 with the original flat keyboard. It could
be a collector's item at some point but I couldn't imagine ever seriously
using such a keyboard in the first place! I guess it would have given
incentive for someone to buy the 800 instead!

An Atari XL series appears in an American made for TV movie, starring John Ritter (Threes' Company) as a 'Mr. Mom' type character, that I believe was produced BEFORE the movie with Michael Keaton, but got buried when the movie hit big.
I also remember a couple of B list Sci-Fi/Horror flicks where an Atari shows up on screen a few times.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Hi,

> SAME problem exists with Basic XL cartridge...

Are you using this as a "Cartridge" or as the "Basic ROM Image"? Note the difference! The ROM Image is for the ROM that is available in the 800XL, though not in the old series, Atari 800 and 400. The Cart Image is for the cartridge slot available for all series, the 800/400/800XL/600XL and 130XE.

Currently, that is for the 1.26, a 'cart image' will not work as basic ROM image (fixed in 1.27). You can tell by checking the size of the image. If it is not 8192 bytes, it is not a ROM image.

In case of doubt, sent the image file over to me and I'll check. Currently, I neither see problems with SmartDos nor with (my) Basic ROM which is an excerpt of my real 800XL.

Last but not least, which Os ROM image are you using?

So long,
Thomas

> a couple of encyclopaedias.

I used to program for CD-i. I can tell you that the graphics engine is both genious and idiotic. The CD-i has two graphics chips output overlay each other, giving two overlayed video planes. You can make 'mattes' in the output of one plane to see what's in the other plane. The graphics chips have a display list through which you can program all sorts of things (like the Agnus in the Amiga, however the CD-i display list is a bit more versatile).

But... There is no provision for sprites or bob's. All moving objects have to be painted by the processor pixel for pixel. Now, the processor is an 68070 at 14MHz, but it shares it's cycles with the graphics processors, so effectively the processor runs at about half it's possible speed, or 7MHz. Now imagine where the Amiga would be if it hadn't had it's blitter chip...

Actually, if Philips had added a $3 blitter chip, the CD-i would have blown away all the game consoles that were out there at the time. Philips has a history of relying on it's sad marketing people, generally people with impaired vision and no heart for their work.

I gathered as much by looking at the speed of the graphics used in the
games. A good example being the dire CDi platform game Laser Lords (this
ain't no Sonic the Hedgehog or Mario Bros). Even Lemmings seems a bit
lathargic compared to the Amiga and PC versions. The encyclopaedias are OK
though, but then they don't rely on blitter chips.

> Actually, if Philips had added a $3 blitter chip, the CD-i would have

Hmmmm. And their slogan was 'Let's Make Things Better', which always made
me laugh, especially after that Team Philips catamaran debacle. BTW I saw
another failed Philips product in Cash Converters on Saturday, a Digital
Compact Cassette 'DCC' player. Mind you not all their innovations are
Edsels, there is the Compact Cassette (AFAIK 40 years old this year) and
of course the Compact Disc.

BTW does a CDi have provision for hardware scrolling of it's video planes?
I notice that in one of the CDi games, Pinball. There is quite fast
full-screen smooth vertical scrolling of the table graphics, with the
silver-ball overlaid on top, and again this manages quite fast smooth
movement. Yet in another game which involves scrolling, Micro-Machines.
The scrolling background is going jerk, jerk, jerk, while the car movement
is fairly smooth.

<rest of tiresomely insecure console advocacy removed>

STOP GOING ON ABOUT WHICH CONSOLE IS SUPPOSEDLY BETTER AND HAS SOLD MORE.
NO-ONE CARES. NOR DOES IT MATTER AT ALL.

Just buy the system with the games which you like. And play them.

Tsch.

That was only part of the hobbling. More important was the "ROM is
cheaper than RAM, so we'll put the programs in ROM" leading to minimal
memory, which wasn't directly accessible at that. On top of that was
that idiotic keyboard which prevented the 99 from being used as anything
but a toy (there was *no* key where the ; goes!), and it was doomed
beforeo it left the factory.

Lynx is my preferred browser. Unfortunately, a bug popped up a year or
two ago (that will supposedly be fixed in the next version) that stopped
the . command from properly launching new xterms which would in turn run
lynx on the link. A browser that doesn't let me spawn windows madly
isn't much use . . .

It don't need to be that powerful, however the floppy controlers and disk formats are not compatable with each other. Original disks, and i should assume most ATRs will be single density images (88-90k). Later, with the 1050 they created a half house format known as 'enhanced density' which isn't double density at 127/128 k (there abouts). True they can still read/write single density. However the way the dos's work are different. There are some software converters out there (mule, i think, a dos converter), also for PCs a hardware fix of an alternative floppy drive controler (Buddah?) converts not only for Atari's but other retro machines as well.

Other than that, take a look at the FAQ. Its extensive indeed.

Well I sent you my config file...and my xl rom image as well as the
smartdos.atr image.

Hopefully we can nail this problem.

For others here, I used the hold-option boot method to disable basic, in
machine type XL mode and using the XL os rom..

What appears to happen is that it loads from the smartdos.atr but before it
displays the dos menu it bombs to the desktop...

If it's double sided does that mean it just treats the whole disk as a
single D: device, or does it treat each side of the disk as a separate disk?
I am guessing the former...?

Treats the whole disk as one device. 360k, only in certains DOS' though. I
use SuperDOS 5.

Hi, I am currently selling some rare copies of Page 6 magazine on eBay.

Page 6 Magazine was an Atari enthusiasts magazine published in the UK
between 1983 and 1995. The early issues were produced in very small
quantities and are extremely hard to find. This auction is for the VERY RARE
issues 2, 3, 4, 5 and 6 which are all in good condition.

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=3041980381

Thanks,
PJR

> A good port of OS-9 would be nice with extra memory support.

Port to what? It's already available for the CoCo 3. OS/A65 is
available for the C=64 and I think the Atari & Apple.

> Uniflex I didn't know it could be interesting.

> LUNIX LNG is the most interesting there should be a port for the 8-bit but
> only so it working in an emulator on the real machine it crashed.

Hmmm...maybe an error when you "installed" it? It's supposed to be for
a real C=64/128, and emulators are supposed to be exactly like the
real thing.

> Anyone like to port any of the OS systems above ?

Port them to what?

# 4805. Vintage Computer Marketplace Grand Opening

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-19 07:09:29 UTC
From: Sellam Ismail <sellam@vintage.org>
Message-ID: <J2k0b.198039$YN5.140214@sccrnsc01>
Source record: 19618

The Vintage Computer Festival is proud to announce the grand opening
of the Vintage Computer Marketplace, THE place on the web to buy,
sell and trade vintage computers!

http://marketplace.vintage.org

The Vintage Computer Marketplace (VCM) has been designed to cater
specifically to the vintage computer collector. The site features
innovative sale and auction tools as well as inventory tools that
allow you to keep a database of your computer collection online. It
also features a powerful search tool to guarantee you find exactly
what you're looking for. No more searches that return dozens or even
hundreds of irrelevant hits.

At the VCM, you can Buy and Sell using standard fixed price and
auction mechanisms. But we also feature innovative sale and auction
mechanisms you won't find anywhere else, plus the ability to trade or
even put items in your collection up for temporary loan.

Our powerful inventory feature allows you to maintain a database of
your entire collection, including hardware, software, documentation,
books, magazines, even ephemera such as posters, buttons, t-shirts,
etc., in one centralized location. Our input forms are intuitive and
easy to use. Once your collection is entered into the database,
selling or trading off items to other collectors is a breeze. Even
the database record gets transfered, so no additional data entry will
be required, and a line of provenance is automatically created. The
VCM really takes computer collecting to the next level!

The VCM offers one of the most powerful search engines on the web.
Instead of putting in your search terms and then sifting through
perhaps dozens or even hundreds of irrelevant links, you can target
your search to exactly the make and model of the item you are looking
for. We've pre-programmed hundreds of computer manufactures and
thousands of models into our database, and are constantly updating it
with new information. When you do a search on the VCM, you'll always
find what you're looking for immediately.

During our grand opening period, the VCM will be free to use for an
initial period of 6 weeks. After that time, the service will still
be free to use for most users. Visit the VCM website and click on the
"Help" link for more information.

The Vintage Computer Marketplace awaits your visit. Sign up now.
It's FREE!

http://marketplace.vintage.org

This is a live beta roll-out of the Vintage Computer Marketplace. As such, you have the option of being actively involved in the final stages of testing and development. Simply check the box in the user registration form indicating you'd like to be enrolled in the VCM Beta Tester mailing list and you'll be able to follow all the behind-the-scenes development and also make suggestions on what features you'd like to see. This is YOUR site. We want your feedback!

We look forward to seeing you on the Vintage Computer Marketplace!

Best regards,

Sellam Ismail and Patrick Rigney
Your Vintage Computer Marketplace SysOps!

# 4806. Version 2.9.2 of cc65 released

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-19 10:01:53 UTC
From: uz@remove-to-reply.musoftware.de
Message-ID: <hisshb.uvf.ln@news.musoftware.de>
Source record: 19619
Cross-posted to: comp.sys.cbm,comp.sys.atari.8bit,comp.sys.apple2.programmer,comp.sys.oric

I'm proud to announce cc65 version 2.9.2. cc65 is a complete cross development package for 65(C)02 systems, including a powerful macro assembler, a C compiler, linker, librarian and several other tools.

cc65 has C and runtime library support for many of the old 6502 machines, including

- The Commodore VIC20 (contributed by Steve Schmidtke <steve_schmidtke@hotmail.com>).

- The Commodore C64 and C128.

- The Commodore C16, C116 and Plus/4.

- The CBM 510 (aka P500), a quite rare Commodore machine (programs run in bank 0).

- The CBM 600/700 family (programs run in bank 1).

- Newer PET machines (not 2001)

- The Apple ][ (library support by Kevin Ruland <kevin@rodin.wustl.edu>)

- The Atari 8 bit machines (thanks to the Atari team: Christian Groessler <cpg@aladdin.de>, Mark Keates <markk@dendrite.co.uk>, Freddy Offenga <taf_offenga@yahoo.com> and David Lloyd, <dmlloyd@atari-central.com>).

- GEOS for the C64 and C128 (by Maciej Witkowiak <ytm@elysium.pl>)

- The Oric Atmos (this one is BETA!).

The libraries are fairly portable, so creating a version for other 6502s shouldn't be too much work.

This is a maintenance release that contains bug fixes for version 2.9.1 (see http://www.cc65.org/bugs.php for a list), but no additional features.

Special care has been taken to make sure that this release works flawlessly together with Contiki, Adam Dunkels internet enabled operating system and desktop environment (http://dunkels.com/adam/contiki/). Thanks a lot, Adam!

Available packages:

As usual I will provide the complete sources and several binary packages, including RPMs for RedHat Linux. Linux is the primary development platform, so the sources do compile out of the box on Linux machines.

Please note that there are separate RPMs for the compiler proper and the target specific libraries. To develop for one of the predefined target

systems you need the compiler RPM package *and* one of the target machine packages.

Binaries for DOS and and Windows will follow or may already be available at the time you read this. OS/2 packages will again be available, but since there are almost no downloads for OS/2, so the host platform may get dropped in the near future (again). As with the RPM packages, you need the package for the development system (Windows, etc.) *and* one or more of the target machine packages.

Download:

For more information and a download link, please visit the cc65 web page at

http://www.cc65.org/

Mailing list:

There is a mailing list for discussing cc65 related issues (programming, suggestions, bugs, ...). See

http://www.cc65.org/#List

for information on how to subscribe to this list.

---

Thanks to all who sent feedback and suggestions, and of course to anyone who helped developing cc65!

The 400 was my first atari. Was also the first atari I saw in the flesh
playing Star raiders. thought it was a brillant computer compared with
apple ][ I saw at the time. still have fond memorys of it. still have it
infact. still remember the smell of it too........

I have no idea. I would just send it in to get repaired. Try the
sites below or you could just ask them:

Hello,

YOu might look into a program called APE. I think it has the
capability to do that. I have done that many times with my setup,
but I have a 32-bit Atari clone and use it as my 8-bit drive #2. I
hook up my Atari 130XE to the clone using a SIO2PC cable. I also
use a 1050 drive as drive #1. Anyhow, I am sure what you want to
do came be done. Enjoy your 800XL. Great machine as I have 3 of
them.

> drive kicking around for my PC;

You could try writeatr (for DOS) from my homepage
http://www.horus.com/~hias/atari/

As I recently discovered, some PC floppy controllers are able to write
enhanced density format! Some others are also able to read it, and
yet some others neither read nor write it. So you've got to try
it out yourself.

If you've got a single density (90k) ATR, you may also write it in
ED format, sectors 721-1040 will then be blanked.

so long,

Hias

# 4814. Best of Creative Computing Volume 3 on the Web

The only reason to play Humanoid is if you're playing solo or against some people where you need the balance. Otherwise, there's just as much challenge playing against three other people, everyone being standard characters- you have a ton of time for creativity that you wouldn't have playing four humans. You could push the argument to say that four Flappers would make the best game, but that's going a bit too far, IMO.

I play a purple Bonzoid every Wednesday on a tricked-out 400 with four Epyx 500xj's, and that's been the story for the past 20 years. The advent of the 46" projection has made finding the wampus a lot easier, and it certainly helped to discover the pattern of which plot you're going to lose if you get hosed by the 'claim' event.

At the end of the day, though, nothing's more satisfying than coaxing Smithore to $250 just in time for round 12. Unless you're also crushing someone that's 12 for 12 in Crystite at the same time, that is.

Man is that game awesome. I just wish I could turn pro.

J.

Not sure if these have been mentioned, but the Airplane movies have
Atari stuff in them. In the 1st movie, there is a screenshot of
Atari's basketball being played on a cockpit screen. And in the 2nd
film, there is the familiar disc reading beeps, and a screen or two of
scrolling text (in a basic graphics mode). Sorry for the hazy details
- going from memory and it's been a long time since I saw either film.

(Shoot, I did it again, hit 'reply' (to lionofjudah) instead
of 'reply group'. Hope LOJ didn't mind.)
Here's what I said:
I tried atari++. Pretty nice. My PIII 667 doesn't
do as fast as a real atari. I had a few crashes, which
went to about a 200x100 windows desktop, couldn't do a normal windows
shutdown, had to ctrl-alt-del two times
to re-boot. I tried my ABC compiled game, 'Keystone Kapers' and 'Sargon
III'. I used a real joystick. All in all a pretty good start for this
windows version, but I'm not throwing away my XLIT just yet:}. SpartaDOS
3.3a worked good, even 'BASIC ON'.

Well, you can sort of do it that way. Boot the Atari (by APE or a regular
disk), and try to copy the disk from a real drive to an image set in APE as
whatever drive you want. Works perfectly well, but only if the disk isn't
copy protected. The best way, IMHO, is to use the ProSystem/10502PC cable to
hook the 1050 directly to your PC.

Hello All,

I currently have some Atari 8-bit stuff for auction on eBay, some of
which are soon to close.

I have an Atari 800/XL/XE SCART cable, the Unusual DOS pack
(1,3,4,XE), and Alien Blast (a version of Space Invaders for light
gun).

The link is below (this may split onto 2 lines, please copy the whole
link into your browser):

I did create proto PCB design for 4mbit Atmel chip. It's 16kb
bankswitched design, which could be turned off - much better than XEGS
scheme, similar to what Sunmark does. Also new shells are available,
although they're not as sexy as original Atari shells and don't have
enough space for a socket.

I would estimate the price to be about 7-10$ (without the flash though).
But it would need larger (100+) series, also note that I'm across the
pond, which would raise the price again (and no PayPal too). So I
dropped the idea.

I agree. This is probably the best way if it works since your PC has a 5i¿½" drive. Worked for me, but I had to erase the disks first with a bulk eraser, otherwise they seemed unreliable.

As mentioned earlier in the thread you can use a cable (sio2pc etc) to connect your Atari to your PC and make the disks that way, or even a 10502pc cable to connect the disk drive to the PC.

The other option is to get a US Doubler upgrade for your 1050, so it can directly read disks made on the PC. You can then convert the ATR images directly to DCM images and use Diskcomm 3.2 on the Atari to expand them onto fresh disks.

Good luck! And let me know if you find a good source of proper black write-protect labels!

Long story with the same point.<grin>

I had bought UIII off the shelf from the old San Jose Computers. After 6-10
quick deaths I put it away for probably a year.

While I was recovering from my bad UIII start AR City came out. That game
was so tough on starting characters that it taught me a new kind of patience
with CRPGs.

I was still under the impression that UIII was tougher then AR City so the
first thing I did was write a character hacking program.

Probably shut off my computer 5-6 times when I got sucked down the whirlpool
figuring I could revive the characters at their last save point with my hack
program.

I was absolutely amazed when I finally left the computer on and saw the
other side of the whirlpool!

After a while I figured out how to play the game fairly well. I mean simple
stuff like making the "Fuzzy Female Fighters" and using their gold to equip
a party. Disbanding and getting the whole party resurected by a ~5th group
member, that kind of stuff.

# 4826. using more than ONE emulator

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-20 20:34:53 UTC
From: rtdos@juno.com
Message-ID: <f927c019.0308201234.fcaac34@posting.google.com>
Source record: 19639

Slightly off topic but I thought I'd share it to those who use more
than one emulator:

http://thesoftpro.tripod.com/downloads/fe/

<SNIP>
This handy utility allows you to manage context menus items of file
objects displayed in a file manager, such as Windows Explorer or any
other application that supports shell's application programming
interface. It's a very simple way to make your often used file actions
quickly accessible. Fast Explorer supports both static and dynamic
menu items and even more. With Fast Explorer you can create new menu
items, submenus, dividers, specify menu bitmaps and hint text, and
manage existing menu items added by other programs. For an ultimate
control over dynamic menu items added from within Fast Explorer, you
can define your own look & feel using the custom-drawing feature.

Menu items can be associated with any file class registered in the
system, including set of predefined shell objects:

* All files;
* All files and file folders;
* All non-associated files;
* All folders;
* All file folders;
* File folder background;
* Entire network;
* All network shares;
* All network servers;
* All printers;
* All drives;
* Audio CD in drive;
* DVD drive.
<SNIP>

and i'd like to add to that list emulator files. Like many of you I
have at least ONE emulator for NEARLY every system thats emulated and
most if not all of these emulators SHARE file extensions (e.g. *.BIN)
and going back and forth between emulators can sometimes get confusing
(not only for you but for the system) and really mess things up. This
neat little program does not install (so i put it in my
%WINDIR%\SYSTEM32 directory and run it from the RUN dialog box). It
is a little tricky but after a while I was able get all file
extensions associated with more than one emulator. It is similiar to
"Open With..." context menu in Windows 2K & XP but a little more
stable IMHO as sometimes (through experience) the "Open With..." list

can get a little screwed up (to say the least) and this little program I do believe works in nearly every version of Windows. File size is around 560 KB.

Just out of curiosity I'd like to know if anyone else has found this program useful (either for emulators or otherwise).

Happy Gaming!

# 4827. Basic XE/XL, MAC/65, and Action for sale on e-bay

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-20 20:55:08 UTC
From: Pete Davis <pdavis68@hotmail.com>

I'm selling a super cartridge I bought from Dan Vernon a while back, along with manuals and diskettes with the toolkits and utils.

I'm moving out of the country, can't take this stuff with me, so unfortunately, I have to get rid of it.

The super cartridge has Basic XE, Basic XL, MAC/65 and Action! on it. All the manuals are in great shape.

The auction is here:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2748795195&category=1247&rd=1

I'd really prefer that this stuff goes to someone who'll really care about it. I hate to part with it, I really do. I love the old Atari stuff.

I'm also selling a 600XL and 1200XL here:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=1247&item=2748797173

These aren't as near and dear to my heart as the cartridge, though.

Anyway, thanks.

Pete

The reality is that if it wasn't for those old computers of yesteryear, we wouldn't have the computers nor the huge gaming console industry which exists today.

It's not that people are poor and can't afford the latest technologies which are usually backward compatible to something older. Take PlayStation 2, it still can play older PlayStation 1 games. Or your PC, going back to days of Unix or MS-DOS command lines.

Some of us, like to renaissance the golden age of computing and video gaming.

Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify
Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

# 4833. Colour of Atari 800 carts?

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-21 15:04:08 UTC
From: Gareth Davies <hotmail.com@dgareth.spm>
Message-ID: <xf51b.9984$z7.1257001@wards.force9.net>
Source record: 19646

Shit, my complete selection of Atari 800 carts was damaged in a flood - the whole lot was then destroyed by a "helpful friend". It's really hit me hard - despite my best efforts my entire collection built up over 23 years has gone without a trace. The hardware did however escape.

I've been trying to put the collection back together but just one question. Almost all of my PAL carts were black: Star Raiders, Missile Command Donkey Kong Junior and so on were black coloured carts. I've noticed that all the carts I've seen recently - advertised on E-bay and very occasionally found at car boot sales - have been grey coloured carts. Is this significant - different production times or something else?

Gareth.

The Grey ones may have been re-releases to match the XE Games system. Atari
did re-release quiet a few in new grey cases at this point.

Ah, that's probably the explanation. It's a real shame then because my old
carts were in absolutely great shape. Most of the grey carts I've seen for
sale are pretty badly scratched.

Hell, this is sad ;-)

Gareth.

# 4836. VCS Paddles on XL?

Howdy *!

I want to play Super Breakout or Arkanoid with paddles. Actually, they are rare and hard to find. I've never seen a special 800/XL/XE version to buy.

However, on ebay i've discovered a set for vcs 2600. Are they also working on xl/xe?

If I remember right, atari was often using such "CLX-####" codes for identifieing their hardware. Has somebody the correct item-number for 8bit?

You need a program to convert ASCII to ATASCII, and there is one out there.
I think it's called IBM2A.exe -let me know if you don't find it and I'll
email you the zip.

# 4843. Re: Running Antic Basic files on an Emulator

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-22 00:39:09 UTC
From: Stephen Anderson <nospam@nowhere.com>
Message-ID: <hnsakvomsiq3anf82nqu6uv63fc3e7rt9f@4ax.com>
Source record: 19556

The basic files will look like garbage becaus they are "tokenized".
Symbols are used to represent the basic commands.

As far as running them, make sure that your emulator starts the Atari
with BASIC on. Then, (depending on DOS used - Sparta Dos you type
"CAR" or Atari DOS 2.x you will press "B". When you get to the BASIC
"Ready" prompt, type "RUN D:filenams.bas".

Stephen Anderson

Jeff

only listed basic files can be viewed with notepad the Atari EOL character is-- Hex 9b -- comes out looking like the greater than sign > or the less than sign < . this might depend also on which font you are viewing the files with. Also any Atari font characters that don't fall into the ANSI standard of IBM will be viewed as garbage. mostly the atari files ending with the extender .BAS will be tokenized code. there is a windows program that will convert tokenized code to .LST called CHKBAS.EXE use a search engine to find the website the information is probably also in the FAQ for Atari 8bits. Also the Atari Vendor FAQ is a great resource for finding information.. I think the file IBM2A.exe only strips the Atari Hex --9b EOL character -- and replaces with the IBM EOL witch is two characters --Hex 0D0A --. TT.EXE is another converter for EOL formating. Here are some

links to good sites:

http://www.faqs.org/faqs/atari-8-bit/faq/

http://xlsearch.atari.org/

http://www.sonic.net/~nbs/new_and_emu.html

http://www.faqs.org/faqs/atari-8-bit/vendev/

http://cth.dtdns.net/

these ought to find you more than enough information. Start with the FAQ.ORG and you should be good.

Getting back to the point, though some larger computer systems may have
Windows, but I'm not aware of any small systems that have curtains.

Hi ppl's,

Many of you would be aware of the Vintage Computer Festival in the US - we are trying to get a similar thing running here (& it will be run by the organisers of the VCF). A Yahoo group has been set up to get the ball rolling. Obviously we need exhibitors & people that'd be interested in attending.

If you're interested, the link to subscribe is :

mailto:VCF-OZ-subscribe@yahoogroups.com

cheers,

Lance

Yep. The standard Atari (VCS/2600) paddles are the ones to use with
the Atari 8-bit computers. Same controller port, same controllers.

Come to think of it

Atari carts were a very dark brown (almost like a plain chocolate brown,
only not as edible) with a 'tin plate' label and edge protector

some third party ones came in other colours, but usualy black (activision
almost always black)

Later Atari re-releases used the XE grey case with no edge protector.

And i'm in the UK. I suppose i could see the brown atari carts darkening
with age

IIRC the carts that were produced when the 400 and 800 were in
production had the 'plain chocolate brown' with yellowish lettering
_labels_(missile command, pac-man, basic, MS Basic II, Star Raiders,
Assembler Editor, Pilot, etc). When the 800/1200XL arrived on the scene
Atari changed the labels to have a different sticker and font, this one
with gray stripes and black, blockish lettering(Robotron 2084, maybe
Pole Position) to match the new style of case. They kept the same
plastic color/style, though, I believe. I think that only changed to the
light gray color when they moved to the XE.

Ok here is the run down in my experience:

The dark brown carts w/aluminum dark label are the original Atari 400/800
era carts.
The dark brown or grey carts w/grey stripped label are the Atari XL era
carts
The grey carts with blue labels are the Atari XE GS carts

Message-ID: <vkciav22qpv7ba@corp.supernews.com>
Source record: 19571

You said you get Atari BASIC to run, so I guess
you're getting the 'READY' screen. (in atari800win)
If that's the case, then all you need to do is type
RUN "D:ADVENT.BAS (one " will do.)
You can't view a tokenized listing in notepad.
Atari LISTed files are the ATASCII readable form.
On a PC, they won't have correct EOLs, but the
&#65533; char (ascii 155). There are ATASCII to ASCII
converters to change ascii 155 to ascii 13,ascii 10
MS EOLs. Somebody mentioned Jindroush's
CHKBAS.EXE program for the pc to convert
tokenized files to Atari Listed files.

Hi guys,

I am an MSX freak, but I also like some other old computers including C64, Sinclair, Amiga and Atari. I have a problem with my Atari 1040ST, so I hope I will get some help in this newsgroup.

I downloaded a lot of .ST images from some German site, they work find under emulator, but I can't transfer them onto a diskette with MAKEDISK utility. Is there any other way to create Atari floppies using .ST images and PC? Are old Atari games available in some other format?

Maybe I am doing something wrong with MAKEDISK, but I can't make a single diskette. Please help the newbie.

Well first off, wrong group! This group is for the Atari 400/800/XL/XE
series.

But here is some info to aid you!

I know on my PC (KT3 Ultra w/AMD 2200+) I have go boot to a DOS Disk and I
use STDISK. (MAKEDISK should work fine see below)

I have to write a 720k ST image FIRST, before it will work (for up to 830k
images!, nothing higher!) But it does work. I used DSDD 720k disks and it
works fine.

Tim

# 4865. classic games vs. todays games

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-23 00:24:06 UTC
From: "Z.Beeblebrox" <qwerty813@hotmail.com>
Message-ID: <ldadnSq2-OzlLtuiXTWJkQ@comcast.com>
Source record: 19578

In an earlier post somebody mentioned how there are aren't too many original games out there nowadays.
I agree for the most part. There are A TON of clones based on the same few game-styles.
With today's games, I love the graphics and sound. Sure, there are a lot of great ones out there!

There are a few reasons (just to name a couple) that the older 8-bit games were so great :

With limited graphics and sound, programmers were forced to rack their brain to develop the meat of the game itself, so to speak. A lot of games today are all "eye candy" (okay, ear candy too).

Simplicity - Try to find a game where you use basic joystick movement and 1 action button. I loved that!! It ruled! It was the bomb!

And I was a kid back then! I think that by itself is why memories of "way back" seem so terrific. It was all "free time" & you could sit and play video game after video game....yes, that was the life.

-cheers,
z

# 4866. Re: Running Antic Basic files on an Emulator

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-23 01:11:10 UTC
From: jeffro9000@yahoo.com
Message-ID: <f70bde2.0308221711.7b69c3a2@posting.google.com>
Source record: 19579

Thanks all for the helpful comments.

I hacked around some more last night and set a "Harddrive" up as
pointing to the directory where the months worth of Antic files were.

LOAD "H1:ADVENTX5.BAS"

And I'm up and running!!

I just typed LIST and watched all of those beautiful lines of BASIC
code scroll up the screen....

(This is one of the listings I never typed in-- but I always wondered
about it....)

My box at home only runs at about %50 speed-- but that doesn't get in
the way of a text adventure too badly....

# 4867. Seeking for ANALOG Adventures

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-23 01:29:52 UTC
From: jeffro9000@yahoo.com
Message-ID: <f70bde2.0308221729.9bf2443@posting.google.com>
Source record: 19580

Brian Moriarity is probably one of the greatest Interactive Fiction authors of all time. He wrote Wishbringer and Trinity for Infocom--but before he worked there he was a steadfast Atarian that wrote for ANALOG.

In issue #11 "Adventure in the Fifth Dimension" appeared and in #18, "Crash Dive" appeared.

Does anyone know where I can find these classic adventure games?

One of the guys at work today was listening to some rap crap or something on the radio and it was loaded with sounds from Pacman. I hate the music, but I thought the SFX were sort of funny to find in a rap song...

Yes!!!

What is now labeled as "retro-gaming" rules!

What the old games lacked in technological innovation (in a modern sense) they more than made up for in creativity.

IMHO I'll be the first to tell you that as much as I love some of the newer games, there is still nothing they can make nowadays that compares to Star Raiders or Rescue on Fractalus, Bruce Lee, etc.

Hey! I didn't know you could do that -- that's a neat feature. It's like APE's PC Mirror feature.

> My box at home only runs at about %50 speed-- but that doesn't get in the way of a text adventure too badly.... <

If you haven't yet, try to set the video to one of the full-screen resolutions (as opposed to a "double-size window" and set the refresh rate to maybe 12 or 15. Your speed should go up significantly.

Larry

(Where find Advent 5th dimension, Crashdive.)
ftp://ftp.spudster.org

Probably best to get the 'all.txt' file and use that
to locate them. Ad5th was in issue #11, 1983.
Crshdv was in issue #18, 1984. I found crashdive,
I'm sure Ad5th is there, but I didn't find it.
You can find the articles, but not the program
listings at the ANALOG project, just Google
cyberroach ANALOG.

# 4874. Atari Basic - XL Edition book on the Web

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-23 19:48:04 UTC
From: Kevin Savetz <usenet-DELETEthisPART@savetz-DELETEthisPART.com>
Message-ID: <usenet-DELETEthisPART-ED3E07.12480423082003@news.west.cox.net>
Source record: 19587

The full text of the 1985 book "Atari Basic - XL Edition" is now online at atariarchives.org. Written by Bob Albrecht, LeRoy Finkel, and Jerald R. Brown, the book presents a guided tour to programming the Atari XL computers in Atari Basic.
http://www.atariarchives.org/basicxl/

The book is the follow-up to the 1979 book "Atari Basic - A Self-Teaching Guide," which is also on the Web at http://www.atariarchives.org/basic/

This is the 19th book to be made available at atariarchives.org.

# 4875. FS: MASSIVE Complete Atari 800XL System

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-23 21:58:34 UTC
From: Brian F <bfurbee@NOSPAM.eastex.net>
Message-ID: <vkfoj2mqt2g371@corp.supernews.com>
Source record: 19588

I have a complete Atari 800XL system that has seen little use in the last few years, and rather than see it die in the attic of old age I thought I would offer it for sale.
The system includes:

Atari 800XL with:
ICD RAMBO 256K Upgrade Installed
AKI - Atari Keyboard Interface from Germany (accepts a standard PC-AT Keyboard)

Atari 1050 Drive with ICD US Doubler Installed
Atari XF-551 Disk Drive (FLAKY!)
Commodore 1702 Composite Color Monitor with Cable

Atari SX-212 Modem

ICD 1 Meg MIO - WORKS! But the serial port is bad
Atari SH204 Hard Drive - formatted for use with MIO
Citizen GSX-130 24-pin Color Dot Matrix Printer (believe it or not Office Depot has the black and color ribbons!)

Atari SpartaDOS X Cartridge
ICD RealTime 8 Cartridge - battery has been replaced within the last 2 years

OSS Action! Cartridge
Atari Assembler/Editor
OSS Basic XL

Atari Light Pen - BOXED with Software
KoalaPad with Software

I have a ton of software and books for this system (probably will exceed the shipping weight of the hardware!). I would prefer to sell the system as a whole unit, but will consider selling it in pieces.

If you have any questions or are interested either reply in this NG or contact me via e-mail at dm@1st-concept.net

Thanks!
-Brian

From: "R. Wayne Arenz" <atari6502@yahoo.com>
Message-ID: <K_62b.80780$hc.46673@fe3.columbus.rr.com>
Source record: 19594

The Atari Computer Enthusiasts of Columbus, Ohio, wish to announce their 2003 swap and sale. Date: Saturday, September 13. Place: the same as it has been (mapquest to: 980 Lenore St., Columbus, Ohio -- Oakland Park Community Center. A bmp scan of the map is available if you have a fast connection or can deal with zip). Time: same as it has been (9 am to 3 pm, EDT). Price: same as it has been ($6 for a table which includes admission for one, $4 for single admission, maximum of $8 for family admission).

What to buy/sell: Though generally anything Atari and Atari-related, we're absolutely tolerant of other game systems, computers, electronics, software, etc. The CCAG gaming show in Cleveland was canceled for 2003 ... you folks are all welcome!

This year ACEC will NOT be doing a massive mailing campaign due to cost. I will be mailing to the 30-odd who indicated they have wished snail mail. Therefore, please help us get the word out: post everywhere of which you know, e-mail your friends, etc. Also, if you wish, let me know of physical and e-mailing addresses for almost-certain attendees. In a similar vein, let me know if you want OFF these mailing lists.

See ACEC's web page at:

http://www.angelfire.com/oh4/acec/acec.html

"8 bit MAC[sic] systems"?

You know, I don't mind the trolling. Every type of computer has its negative aspects. It's actually perfectly valid to say, for various reasons, that any system, from the Atanasoff-Berry Computer down to a PowerMac G5, sucks. So generally, I would have left this post alone, under the heading of "please don't feed the trolls."

But I do wish that the trolls wouldn't include incorrect assumptions in their trolling questions. There never was an 8-bit Macintosh*. And "Mac" is short for "Macintosh" -- it's not a three-letter acronym for anything, so it doesn't need to be capitalized for all three letters.

*There were several models of 8-bit Apple computers. Most of them were in the Apple II series. Confusingly, there was also a series of Macintosh called the Macintosh II, but they are not interchangeable.

LionOfJudah wrote:

> How can I set it to run at my computer's full speed? Possible? Or can I
> inrease the speed by a multiple?

See the Speed menu; you might want to increase the "MaxMiss" slider to allow the emulator to drop some frames to 'catch up'. It currently does not allow to run faster than a real Atari, though, only slower (for games and such).

For Basic programs, you want to try to install the math pack patch, to be found in the OsRom menu. It increases the speed for the floating point computations by implementing them in the "host".

So long,
Thomas

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

You mean that there are *more* than 256 network cards?! Has the world
gone mad, or what? :-)

Isn't MAC addresses used for other equipment than network cards too?
Or at least other network equipment than those speaking Ethernet.

Of course, there is a possiblity Onno was trying to make a reference
to the Atari assembler MAC/65.

From the Webopedia: (yes, I know I shouldn't believe everything I read)

MAC address
Short for Media Access Control address, a hardware address that
uniquely identifies each node of a network.

> Of course, there is a possiblity Onno was trying to make a reference
> to the Atari assembler MAC/65.

Of course. Atary are even gayersterer and assembly is for wimps.

Definitely mad!
See I told them that the QL Net/ZX Net was *THE* Way to go but they just
didn't listen to me :-P

(Seriously now anyone has a Speccy/IF1 and a QL with MG ROM or TK2) try it
and you will be amazed... (A rather genious trick is to use the QL's net to
play sound for the Speccy emulator on the QL... 3 channel no less!)

I can tell you that my 5 and 8year old sons seem to prefer to play my
classic Atari games over some of their PS2 and Gameboy Advance games
(except the newer Mario Bro's series on GBA).

They can play LodeRunner, PacMan, Wargames, etc for hours if I were to let
them. I can only assume it's because the game play is more unique than the
typical hack-and-slash found on most new games.

The games were tighter, too, due to fewer lines of code. Hardly any had
bugs that completely wrecked the experience, and this was in an era
where "patches" or "v2.0" didn't exist.

# 4899. Re: Colour of Atari 800 carts?

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-26 18:54:57 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3F4BAD01.AA87D4EA@students.uni-mainz.de>
Source record: 19512

Well,
if you are a collector and you are looking for label colour differences,
you can collect some carts quite often. For example, Star Raider/s comes
as:
a) Star Raider with a black label
b) Star Raiders with an orange or orange-brown label
c) Star Raiders with a brown label
The same is true for most other Atari carts, meaning many of them can be
found in either 400/800 (mostly brown/orange-brown) style, and/or XL
(silver) style and/or XE/XEGS (silver labels with grey cases) style.
Only a few ones are restricted to one style (I have not seen a Super
Breakout, Pacman or Donkey Kong cart in XL or XE style yet; looks like
they only exist in 400/800 style; a few XE carts seem to exist only in
Taiwan style, for example Archon and Star Raiders 2 cannot be found in
Hong Kong style; etc. etc.)

Last not least, something special about Star Raiders, there also exists
a version
d) Star Raiders with a silver label (this one is a rarity: it has an XL
type silver label, an A5 box in black/red 400/800 style and finally a
blue/white manual in XE/XEGS style; alas, the cart itself is incomplete
- one ROM chip is missing and furthermore the cart PCB differs from the
other versions; looks like Atari recycled all rest capacities
here...) greetings, Andreas.

I've brought up this point quite often when talking with co-workers and it's great to read that someone else remembers this as well. Of course I know games nowadays are significantly more sophisticated, take months and years to produce, and require teams of people to make, but Q & A has suffered an inordinate amount in the process. Give me the days when the full version of a game you saved your money for was the only version you ever needed.

I am *not* sure about the manual, but you can order printer
ribbons for this printer (it is the same printer as an
Okidata 80) per the following email I received:

Thank you for visiting OFFICEWORLD.COM!

In response to your inquiry, please use the following item number(s) in the
Search box on our web page (www.officeworld.com) to pull up a picture and
details of the item(s) that would match the information you gave me.

ITEM NUMBER(S)
NUKBM176-For Okidata Printers Microline 80-$2.45ea

Once you find the item you are looking for, you can start the ordering
process on that same screen.

I hope this information helps. Please let us know if we can be further
assistance to you.

Have a wonderful day!

# 4904. FS:Many boxed+new ATARI XL/XE cartridge games

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-27 07:58:08 UTC
From: Ulrich_Sternaxe@gmx.de
Message-ID: <f16cbc23.0308262358.12974476@posting.google.com>
Source record: 19517

Hi,

I offer the following ATARI XL/XE cartridge games by ATARI.

All the games are boxed and new , still factory-sealed in original shrinkwrap.

The games are US/English versions , they work on NTSC and PAL systems - there are no PAL-NTSC differences as known on the ATARI 2600.

I can ship worldwide :

$14 for a package of up to 15 games as surface mail (slow , 3-8 weeks)
$32 for a package of up to 40-45 games as surface mail (slow , 3-6 weeks)
$23 for a package of up to 8 games as Air Mail (fast , a few days)
$33 for a package of up to 15 games as Air Mail (fast , a few days)
$48 for a package of up to 40-45 games as Air Mail (fast , a few days)

Europe :

8.20 Euro for a package of up to 15 games
16.50 Euro for a package of up to 40-45 games

Please note : Paddles/Joysticks/Keyboard Controllers weigh about 3 times as much as 1 game.

I can accept PAYPAL.Cash for very small orders or money orders/checks for bigger orders (because of bank fees).

Please note : The XL games in silver boxes - Millipede/Robotron etc. work on all ATARI computers - ATARI 400,800,XL machines,XE machines.

The XEGS carts - such as Rescue on Fractalus , Archon etc. require at least 48K of memory , some - like Airball - only work with 64K , so these games may not be compatible with the ATARI 400/800 , but will work on ATARI 800 XL/800 XE , 65 XE/130 XE , 1200 XL and XE Gamesystem and 600XL with 64K memory.

Mathias

ulrich_sternaxe@gmx.de

List :

Ace of Aces $7
Airball $8
Archon $6
Ballblazer $5

Crimebuster $7
Crossbow $3
Davidï¿½s Midnight Magic $5
Desert Falcon $5
Eastern Front 1941 $7
Final Legacy $5
Gato $5
Hardball $5
Joust $5
Loderunner $7
Millipede (large box) $4
Millipede (small box) $4
Moon Patrol $6
One on One Basketball $5
Pole Position $5
Rescue on Fractalus $8
Robotron 2084 $6
RS Football $7
Star Raiders 2 $6
Thunderfox $5
Tennis $5

Disk :

Mickey in the Great Outdoors $3
Microsoft BASIC $10 (heavy box ,weighs as much as 9
cart games)

Cassette

Scram $4
Touch Typing $5

...and where's the sexuality in such a case? That's right, in the
brains of the human "voyeur", NOT in the computers..... humans are
perfectly capable to think even the most a-sexual thing is very very
sexy. It's all in the eyes^H^H^H^H^Hbrains of the beholder....

And do you know what FETISH means. A fetish is something that
is REQUIRED in order to induce sexual arousal. If this is true, then
he has to have the visual of one of those computers in order to have
sex at all. ;-)

We used to have a TRS-80 nut at work. There were rumors floating around
that late at night he would sit naked in front of his computer and play with
his joystick.

## 4918. "Early Video Game Pioneers"

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-28 02:15:41 UTC
From: llppwhite@aol.comnsp
Message-ID: <20030827221541.18208.00000040@mb-m06.aol.com>
Source record: 19531

Just watched an excellent 1-hour TV program on the (Discovery) Science Channel. It's channel 193 on the DISH Network. This type of segment is called "Digital Domain" and this particular show was "Early Video Game Pioneers". This covered PONG through the GameBoy with interviews with the "big names" like Bushnell, etc. It will be on again tonight at 12:00 midnight (New York time). Many of these programs are carried on different Discovery channels, so it may show up elsewhere later. It's an hour well-spent, I think. ZAP! is certainly more complete as regards Atari, but the video interviews are excellent!
Larry

Hello again,

The Okidata site was the first place that I looked. The user info refers to
models ML82A,83A, and 84 but not the ML80. When I get this hooked up, I'll
experiment with control codes to see what happens. Thanks again.

Ralph

Bill Gates on television said "The British had some good computers too, the Sinclair ones for example - Pity they didn't run DOS though". One of the reasons they are good is that they did not.

> > The PC has no colour or graphics, never mind high-res
> > ones.
> You mean it "had" no color or graphics. Actually it had 16 colors, but
> you'll find new PCs far outdo anything your "Speccy' can do.
That was EGA (Enhanced Graphics Adapter).

[snip]
> It wasn't the first
> IBM PC that beat your "Speccy" anyway. It was the likes of Commodore,
> Apple, Atari, and Radio Shack that beat it.
The Sinclair ZX81 (launched in 1981) sold more than any other computer had every sold, at that time. While the follow up computer the Sinclair ZX Spectrum was even more successful. Outside of the USA where the Spectrum was not aimed at so much after Timex Computers closed down, the Spectrum easily beat the last 3. I bet that users of some of the above 3 systems do not say anything, because there are non of them left, among other reasons.
Hi Apple, Atari, Radio Shack users. While these computer are fine, not everybody is rich and can afford to spend over a thousand pounds for an Apple II. Thats many thousands of US Dollars in real terms. The Spectrum is just as good, if not better than these 3, and was a computer for the masses and had the greatest games.
As for Commodore PET/Vic 20/C64, don't get me started, many flame wars have been fort over this issue, over points like the problems with C64 BASIC (hi-res grahics etc).

> I don't know what the "M$ PC" is, but OS/2 runs on PCs, yet you have it
> listed as something that beats PCs! Unix also runs on PCs.
You are missing the point, Un*x is better than M$ Windows. Portables would have better battery life if they used the ARM CPU (the worlds most popular processor), but because of the M$ monopoly they can't. As I write this on an ARM based system running RISC OS, while Intel still have not produced a successful RISC architecture of their own yet, i860/i960 and Itanium have all failed so far. An Athlon can use 75 Watts while the ARM

in this computer uses less than half a watt.
Bill Gates meet Hermann Hauser co-founder of Acorn to persuade him to
use use M$-DOS on his popular BBC Micros. Hermann said why would I want
make such a retrograde step as that, when BBC BASIC is better than
GW-BASIC and the BBC Micro has built in networking. Bill Gates said what
is networking, is this the man *you* want running the computer industry.

# 4926. Converting the Antic Files to ATR

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-28 19:46:27 UTC
From: jeffro9000@yahoo.com
Message-ID: <f70bde2.0308281146.54543f86@posting.google.com>
Source record: 19539

Hi... I've figured out how to...

Load in .BAS files and then save them to the standard DOS 2.5
"diskette" atr files.

I've also figured out how to connect to a directory and treat it as a
virtual harddrive for the Atari. (It uses drive H1, H2, H3, and H4.)

What I want to do is copy files from the Hard Drives to the ATR
diskette files.

I can't even remember how to use DOS to copy files from one disk to
another right now so I'm a little lost here....

Any ideas on how to do this...? Thanks!

The Vintage Computer Festival is proud to announce the grand opening of the Vintage Computer Marketplace, THE place on the web to buy, sell and trade vintage computers!

http://marketplace.vintage.org

The Vintage Computer Marketplace (VCM) has been designed to cater specifically to the vintage computer collector. The site features innovative sale and auction tools as well as inventory tools that allow you to keep a database of your computer collection online. It also features a powerful search tool to guarantee you find exactly what you're looking for. No more searches that return dozens or even hundreds of irrelevant hits.

At the VCM, you can Buy and Sell using standard fixed price and auction mechanisms. But we also feature innovative sale and auction mechanisms you won't find anywhere else, plus the ability to trade or even put items in your collection up for temporary loan.

Our powerful inventory feature allows you to maintain a database of your entire collection, including hardware, software, documentation, books, magazines, even ephemera such as posters, buttons, t-shirts, etc., in one centralized location. Our input forms are intuitive and easy to use. Once your collection is entered into the database, selling or trading off items to other collectors is a breeze. Even the database record gets transfered, so no additional data entry will be required, and a line of provenance is automatically created. The VCM really takes computer collecting to the next level!

The VCM offers one of the most powerful search engines on the web. Instead of putting in your search terms and then sifting through perhaps dozens or even hundreds of irrelevant links, you can target your search to exactly the make and model of the item you are looking for. We've pre-programmed hundreds of computer manufactures and thousands of models into our database, and are constantly updating it with new information. When you do a search on the VCM, you'll always find what you're looking for immediately.

During our grand opening period, the VCM will be free to use for an initial period of 6 weeks. After that time, the service will still be free to use for most users. Visit the VCM website and click on the "Help" link for more information.

The Vintage Computer Marketplace awaits your visit. Sign up now. It's FREE!

This is a live beta roll-out of the Vintage Computer Marketplace. As
such, you have the option of being actively involved in the final
stages of testing and development. Simply check the box in the user
registration form indicating you'd like to be enrolled in the VCM Beta

Tester mailing list and you'll be able to follow all the behind-the-scenes development and also make suggestions on what features you'd like to see. This is YOUR site. We want your feedback!

We look forward to seeing you on the Vintage Computer Marketplace!

Best regards,

Sellam Ismail and Patrick Rigney

I want to copy the files from DOS to Atari disk image. How?

Hon Tseng

# 4932. Hello and please help!

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-29 06:02:01 UTC
From: Thomas Rahbar <rahbart@cox.net>
Message-ID: <t%B3b.102000$lj4.19279@news2.central.cox.net>
Source record: 19545

Hello all! I am a 31 year old from the 80's. I used to run a BBS on my Atari 800xl with limited hours, then upgraded to a 130xe with memory expansion, MIO, and hard disk. I had every program you could think of. I grew up on these babies and now i'm dusting my stuff off (I still have everything). I was wondering what the general consensus was as far as upgrades. I've been doing alot of research and it seems that a SuperVideo, SIO2IDE, SIO2PC, and SIO21050 are the ultimate upgrades. Anyone have any other suggestions? I'm wanting to do these upgrades but don't know where to buy this stuff from. Seems most of these items are in the UK. I feel like a newbie all over again. Aaron from 'atari holmes' sent me here to check it out. Hope to make some new friends here and maybe even touch base with some old 8bit users. Thanks!

Thomas

Depending on your particular computer (and assuming you have a diskette or
image with dup.sys on it loaded), type "DOS" and then select option C.

Format is...

[source drive/filename],[destination drive/filename]

So it would look like... D1:JUNKFILE.BAS,D2:JUNKFILE.BAS
You can also use wildcards, but I would expect you already know that.

Consider fitting a Warp chip. It means you can boot up as a stock 400/800 and use programs and menu disks that aren't XL compatible without needing a translator disk. Plus the Warp OS is there too for when you upgrade your floppy to DD. Also you can reverse basic so you have to hold down option to /enable/ basic rather than disable it.

I installed it and it is excellent!

There was a film Titled "Flashpoint" in 1984 starring Treat Williams & Kris Kristofferson that I worked on (as production sound mixer).
Part of the plot involved computer based seismic detectors for detecting illegals coming across the border. A couple of scenes revolve around the main characters being tracked by this system. They hired a Hollywood based company to create the graphics and computer displays. When they submitted them, the director told them they didn't work with the script and looked too primitive. So, I was a budding Atari programmer and told him I could do better on my Atari 800 which I had in my hotel room. He said "great" and I ended up creating all the graphics used in the movie on my Atari 800. I had to write the software at night after a long day of shooting, so I didn't have much time to polish, but they all ended up playing a major role in the movie.

Hi
I'm selling some copies of Page 6 Magazine on eBay.
Page 6 Magazine was an Atari enthusiasts magazine published in the UK
between 1983 and 1995. The early issues were produced in very small
quantities and are extremely hard to find. This auction is for issues 4, 5,
6, 7 and 8 which are all complete and in clean condition.
Thanks,
PJR

# 4953. Atari @ Vintage Computer Festival

Newsgroup: comp.sys.atari.8bit
Date: 2003-08-31 08:44:42 UTC
From: bill@newbreedsoftware.com
Message-ID: <_zi4b.16949$dk4.554239@typhoon.sonic.net>
Source record: 19466

I didn't notice any Atari stuff being exhibited at the
Vintage Computer Festival (this October in Mountain View, CA),
so I decided to click the "Click here to Exhibit!" button. ;^)

http://www.vintage.org/2003/main/exhibit.php

So I'm thinking of bringing a Linux laptop running SIO2PC-style
software (if I can get it working; otherwise, it's the ol' 1050 drive)
to show off some recent (1990s to today) software... especially games
and demos that really show off the power of the hardware. :^)

No confirmation that they're gonna let me come exhibit, but I'm guessing
the chances are good. ;^) Wish me luck!!!

-bill!

> But the ATARI also is quite gay...

You again. You're nothing more than a spammer. You simply have nothing
better to do than to just crap on about nothing! Next you'll say that
the designers were gay.

So what's this to do with Amstrad's I say?

You can't even raise a serious discussion about Amstrads yet you
continue to post here, why?

# 4959. Itay Chamiel's Ice-T Homepage Gone?

Newsgroup: comp.sys.atari.8bit

Frequently Asked Questions about ALT.BINARIES.KARAOKE V1.92

-=-=- Section on Copyrighted Material Revised -=-=-

============================================================
Based on the "Newcomer's Message" by Bunty Pritchard Jones,
et al, and distributed weekly by Alan Sharkis. To view this
message in html form, please go to:

http://members.chello.nl/~j.a.komrij/faq.html

============================================================
THIS NEWSGROUP IS FOR THE EXCHANGE AND
DISCUSSION OF _MIDI-KARAOKE_ FILES!
============================================================

In this group you'll find people, from many different
countries, committed to making and sharing MIDI karaoke
files using MIDI sequences. Please do not post messages
concerning other format files such as MP3 or CD&G, etc.,
here, since they are considered off-topic. For MP3,
CD+G, etc., visit the newsgroups:

alt.binaries.sounds.karaoke

OR

alt.music.karaoke

To get you started with .kar files and midi-karaoke on the World Wide
Web, visit:

http://members.chello.nl/~j.a.komrij/alt_binaries_karaoke.htm

For a FAQ regarding midi-karaoke visit or download:

http://www.computer-karaoke.com/karfaq.shtml

by Raphael Pungin.

To know more about this group, read the following questions.
If you have more questions, then you can post them so that
they can be answered or even incorporated in this FAQ. Your
observations, contributions and comments are welcome.
```

->

>Q: I'm looking for a particular midi-karaoke. Where can I
find it?

A: You can make a request to this group. Put "REQ" first in
the subject line of your post. Many users have a huge database,
so there's a good chance it will be posted or e-mailed to you
for download. If you wish to search the Web for midi-karaoke
files, there are some search engines specifically made of the
task. An excellent one can be found at:

http://www.vanbasco.com/midisearch.html

->

>Q: How do I play these files?

A: You can play them in a midi sequencer that will display
text events. But it's much easier to play them with a midi-
karaoke player. There are many of these and each has a
different set of features. The following are freeware for
the PC:

vanBasco:
http://www.vanbasco.com

winKaraoke Player
http://www.francisli.org/wink/default.htm

A member of the group reported that downloading this player will also
also automatically install a time-correction program, complete with
pop-up ads and spyware. The time-correction program can be
uninstalled easily and the spyware can be uninstalled with a utility
such as Ad-Aware.

Mark's Player
http://members.chello.nl/~j.a.komrij/alt_binaries_karaoke.htm

A good shareware player for the PC is Karawin. You will
find a link to it's site at:

http://members.chello.nl/~j.a.komrij/alt_binaries_karaoke.htm

There are also commercial players for the PC as well as
players for other platforms. Consult

http://members.chello.nl/~j.a.komrij/alt_binaries_karaoke.htm

for links to those other players.

->
>Q: I've heard that Winamp can be used as a .kar file player. Is this possible?

A: This can be answered with a qualified "yes." The two latest
versions of Winamp(2.91 and 3.0) will NOT do it without some
complicated "backdating" of some .dll files. If you wish to try, you

can find them at the Nullsoft site:

http://www.winamp.com

But version 2.81, an older version will do it with the appropriate
plug-ins. Version 2.81 can still be downloaded at:

http://download.spectral.ro/cgi-bin/download/program3.cgi?exe=winamp281_full.exe

->

>Q: What about QuickTime?

A: QuickTime Plugin 6.0, when properly configured, comes up in your
browser and display the lyrics of .kar files that might be found at a
Web site. A .kar file can be loaded into your browser while offline
and the QuickTime Plugin will play it.

->

>Q: Where can I find freeware for making my own midi-
karaoke files?

A: Look at the following sites:

Karakan
http://members.chello.nl/~j.a.komrij/karakan.htm
OR
http://www.computer-karaoke.com/karother.shtml

WinKaraoke Creator
http://www.francisli.org/wink/default.htm

MidiX
http://members.chello.nl/~j.a.komrij/midix.htm
->

>Q: I am making my own midi-karaoke's and I need help.
What to do?

A: You are in the right group. Most users here can help
or give some advice on hot to solve any problems you
may encounter.

->

>Q: I have a midi-karaoke with a copyright notice. What
should I do?

A: Tune 1000, Trycho files and files from "Geerdes midi
systems Berlin." are files that are commercial and
copyrighted, as are files from Midi Hits
and Tran Tracks and many others. Use them at your own discretion.
Distribution of copyrighted material could be illegal. You can
recognize Trycho midi's when they are copyrighted by
Trycho, TMI or Stephen Kern (the man behind Trycho).

->

>Q: I don't like a midi(karaoke)-sequence and want to change it to make it sound better on my configuration. Is that OK?

A: This is about some form of etiquette, really. Sequences can always be changed for your own private use or taste, but do not repost or redistribute them without asking permission or approval from the original sequencer/author.

->

>Q: What is flooding?

A: Flooding is the term for the result of an individual posting many files in a short period of time. Flooding is done in many other newsgroups. Flooding is not completely discouraged in ABK. However, since many users do not have broadband connections, some are forced to download entire messages rather than just headers, and people organize their files differently, you can use these guidelines for making your contributions:

1. Limit any posting to a maximum of fifty (50) files per day.

2. Organize files you post; either alphabetically or by category (by artist, by topic, by language, by time period or style, etc.)

3. Post a message describing the set of files you post, so that people who are not interested in that set can skip it (or delete it if they are forced to download entire messages.)

4. The use of zip archives, with a limit of twenty (20) files per zip, arranged by category is greatly encouraged. It would also be helpful to include a short text file in the zip, describing the karaoke files in the zip.

->

>Q: I have read discussion in the group about a midi-karaoke file that didn't appear on my server and I'd love to have it. Should I request that it be reposted?

A: As you are probably aware, newsgroups present a problem in that posts don't always show up immediately. There will be some delay before some news servers get them. As a result, some users miss posts. This problem can be very severe in binary groups where multiple-part zips are attached to several messages and people who subscribe to these groups are often advised to use a paying news service.

Fortunately, ABK rarely shows that problem. If you know that a file has been posted but you didn't see it, ask for a repost. Somebody will usually repost it for you. If you were the original poster of the file, but don't see it right away, you might try waiting a day or two before asking if it showed up. Sometimes files show up quickly on everyone else's server but yours!

->

>Q: Sometimes I seem any messages with the same filename mentioned in the subject-line. They have numbers like (0/17) and (3/10) in them. If I try to open the messages, I see what appears to be random characters. How do I get these files to work?

A: What you are seeing are multi-part files. Usually they are posted to newsgroups when the files are very large. In ABK, we rarely see such large files. However, some ISP's, AOL in particular, severely limit ythe size of a message posted to a newsgroup. One way around that is to post multi-part files with each part attached to a separate message. There are programs that will do that automatically for the person who is posting them.

Now the fun starts for those of us who want the file once it's posted! Usually the (0/n) is a message that describes the file in plain language, with the "n" being the number of parts of the file you can expect. The other messages are numbered with the consecutive parts of the file.

Without getting too technical, all binary files, whether single-part or multi-part, must be encoded (usually with a system called MIME 64) to be transmitted via newsgroups, which really only use plain text. They must be decoded at your end. All the news reader programs can decode single-part files. But not all news reader programs can combine and decode multi-part files. For a list of those that can, including Outlook Express, and tutorials on how to do the job, visit:

http://www.smr-usenet.com/tutor/ppost.shtml

There are also links at that site that will take you to the home pages of some popular news reader programs and other newsgroup-related utility programs. Additionally you can get YencPost version 1.03 at:

http://www.smr-usenet.com/software/misc.shtml

and Powerpost at:

http://www.cosmicwolf.com

->

>Q: You mentioned YencPost. What is yEncoding and why
can't my newsreader decode it?

A: yEncoding is a method of encoding that is different
from the MIME 64 encoding mentioned in the last answer.
It's popular among some posters in some newsgroups. It
seems to make more efficient use of bandwidth. There
are newsreaders that will decode messages encoded with
yEncoding. They include YencPost and Forte Agent 1.91.
Unfortunately, they do NOT include Outlook Express.

There are many free encoders, decoders and news reader
programs that will handle yEncoding listed at this
site:

http://www.yenc.org/windows.htm

->

>Q: Can anyone tell me if there's a little program that can convert midi to wav files? What about .kar files to wav or mp3?

A: The same thing either way, .kar files are MIDI files.

The simplest method is recording the output of your MIDI synth as it
plays. If your soundcard can record the synth out (check in Windows
mixer, options/properties/recording), the just use a sound recording
program and a MIDI player together.

If you don't like your synth sounds, you can upgrade them and gain
MIDI to audio file conversion using Roland's VSC88 software synth.
www.edirol.com -- it isn't freeware but it does work very well for
this purpose.

There is also a program for doing this in an easy way. It's midi2wav,
which can be found at:
http://www.midi2wav.com/index.html

Its about $15.

A Web site that links to the site of other, similar programs and gives
advice on how to use them is listed below. Thanks to CowYow for this
source:

http://www.musicmasterworks.com/midi_to_wave_converter.html

Thanks for reading and enjoy this group and midi-karaoke!

Assuming you have some electronics ability...

Open up the drive, remove the shield and reseat all of the socketed chips.

Clean the r/w head, don't get the pressure pad wet.

Make sure the power supply is good/the right one. 9VAC 31VA or bigger.

Make sure no pins are bent/shorted in the SIO jacks.

Better asked in comp.sys.atari.st.

But..you need a dma to scsi adapter for the ST..usually ICD, and a power supply and box. ICD Link II is probably the best right now. It will have software drivers.

IDE is a whole other beast.

From: Russ Gilbert <russg@en.com>
Message-ID: <vl4fegcj2f75ba@corp.supernews.com>
Source record: 19480

The FAQ mentions either AC or DC, says, 6.2 to 7.2 volts or so.
I believe the MIO needs 9 volts, either AC or DC. If DC I'm pretty
sure the center is +. A standard Atari 9V AC for the 1050 would
probably be ok. Probably a little less heat with 9.2V DC, thinking
DC would heat the diodes less than AC.

Steve is selling the AtariMax flash cart, of which I bought two. Gemdrop
was the first game I tried out on the cart. I wonder if he took the image
and just put it on a flash cart...

Steve has also put together some software to easily convert disk images to
a cartridge format.

> Anyway, thanks Steven! It's _totally_ awesome to have one of my
> very own games in cartridge form!!!

And I recommend to everyone to go pick yourself up the atarimax flash cart:
http://www.atarimax.com/flashcart/documentation/

From: RoyE <r-dean@charter.net>
Message-ID: <vl679ei6gpld1e@corp.supernews.com>
Source record: 19484

Hi Thomas,

Right from the FAQ's listing the indus as the following. Posted here every
60 days. It doesn't mention anything about the polarity of the connector.
Atari 8-Bit Computers: Frequently Asked Questions

9.3 V DC 1.93 A (18 W) Atari#CO18187
Indus GT,5200

11.5 V DC 1.95 A (22 W) Atari#CA019141
Indus GT,5200
I have heard that the 9vac will burn out some components if plugged into the
IndusGT. Good Luck.

Regards,
RoyE

Doesn't matter what polarity is the centre is. the MIO has a fullwave bridge
rectifer in it.

Ac would be better because the diodes would be used half the time.

James

Right.
You have blown either the power supply or some parts of the Indus.
I blew a 9v ac ps that way. The Indus used the same size and shape
plug, but a different supply (11, 12 or 9v DC). Let's just hope it was the
ps.
You can probably recover the ps if you crack it open and replace the
fuse. You have to cut open those Atari ps.

## 4978. Redefining the Charater Set -- Perfected at long last?

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-01 20:46:24 UTC
From: bcozier@bellsouth.net
Message-ID: <a4fbe403.0309011246.3bd58a1d@posting.google.com>
Source record: 19491

```
PLA
STA 212
STA 203
STA 208
LDA 106
SEC
SBC #4
AND #$FC
STA 209
STA 213
STA 106
LDA #224
STA 204
RTS
```

What the routine *above* is supposed to do is reserve memory for a new character set and return the address of the new CSET as the value of the USR function. It also sets up 203,204 to point to the charset stored in ROM and 208,209 to point to the new CSET in RAM.

The routine is relocatable and is meant to be called as :

```
30000 MYCSET = USR(ADR("mlcode_*above*_in_string_form"))
30010 GRAPHICS GRMODE
30020 H = USR(ADR("mlcode_*below*_in_string_form"))
30030 RETURN
```

The routine *below* copies the old charset in ROM (203,204) to the new CSET at (208,209). As a bonus I return 256 as the value of H which is a common value used in many calculations by basic programs.

```
PLA
STA 212
TAX
TAY
INX
STX 213
LDX #4
COPY LDA (203),Y
STA (208),Y
INY
BNE COPY
DEX
BEQ DONE
INC 204
INC 209
```

```
BNE COPY
DONE LDA 106
STA 756
RTS
```

The reason I broke it up into two separate routines was so the user could GOSUB after setting the desired GRMODE value, and the GRAPHICS command is needed to move all the graphics display stuff below the new RAMTOP value specified in 106.

Is this about as memory and execution efficient as this can be done in Atari basic? Or can you see any optimization in the ML routines? It's cool how the ml code can be called directly using USR to a literal string value that isn't assigned to any variable...

I put the challenge to anyone...can you make this any more efficient (space or execution time) ??

In case you're wondering, I was feeling extra nerdy today.

Also email me if you want the atari basic LST file that you can ENTER for the routine 30000 to 30030 above. I call it in direct mode to test it like follows :

```
GOSUB 30000:POKE MYCSET,255
```

That causes the entire screen to have like underlines...

Hi,

> Is this about as memory and execution efficient as this can be done in
> Atari basic? Or can you see any optimization in the ML routines?

At least, there's another error condition you could check for, namely
out of memory situation. You should check whether the new value of
RAMTOP (106) is still below MemTop ($e,$f). This would avoid overwriting
long basic programs that reach into the 1K of memory you reserved for
characters.
Another possibilty would be to have a separate routine for the character
sets of the Antic 6 and 7 modes (Gr. 1, Gr. 2) which are only half of the
size.

Greetings,
Thomas

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

## 4989. Looking for a BASIC compiler.

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-02 11:34:58 UTC
From: The Undead Mechanic <davidb81@earthlink.net>
Message-ID: <Cf%4b.5686$tw6.4864@newsread4.news.pas.earthlink.net>
Source record: 19352

I am looking for a BASIC compiler that doesn't require a runtime to operate.
I need one that creates pure ML compiled programs.

So far, every thing I have ever tried needs a runtime to work. I'm
particularly interested in the MMG compiler, but I haven't been able to find
one available for download.

Anyone here think you can help me out?

Thanks a lot.

Hi,

> I am looking for a BASIC compiler that doesn't require a runtime to operate.
> I need one that creates pure ML compiled programs.

Every compiler I know requires some kind of run-time environment, just
to support the basic command set. However, some compilers link the run
time library to the resulting code, hence creating a binary load file that
can be executed from DOS or a game dos. For example, the ABC compiler works
this way.

Greetings,
Thomas

I've seen MMG compiled programs - though not the compiler. /-: It also
includes something like a run-time library. It's just that you don't see
it, it comes automatically with the compiled code.

So long,
Thomas

Not sure I understand...you mean the basic program in memory might
already be invading the space I want to reserve for my charset? I
guess I took it for granted that the programmer would make sure that
doesn't happen because otherwise the program can't run...it's a good
suggestion for completion's sake but not sure I want to add more code
for this case that the programmer will have to work around anyway...

> Another possibilty would be to have a separate routine for the character
> sets of the Antic 6 and 7 modes (Gr. 1, Gr. 2) which are only half of the

True...but then I would also have to add code to specify which half of
the charset they want copied into the new set to work with...also what
if they use a gr. 0 text window in gr.1 or gr.2 would they still need
the full charset? Another advantage of reserving the whole thing it
makes character animation in modes 1 and 2 possible...maybe ultima did
this to animate it's "characters" ?

That's handy to know. I'm cool with that. I just want to get away from
having to load a runtime before actually starting up the intended program.

For the project I'm working on right now, speed is extremely important and
I'm too lazy to actually write a program of this size in assembly. So, for
the time being, the compiler is getting the job done. I imagine that in the
end, I'm going to have to just break down and do all this crap over again in
assembly, but I *really* don't want to do that.

I don't remember anything on 2.5, but there was 'Inside Atari DOS'
which had the full source listing for DOS 2.0.

Just a few words of warning: The compiler does output one continuous file
like you want but IIRC the code starts pretty low in memory. It will work
for everything that doesn't bump memlo to high. If you load a couple of
bloated drivers, like the MMP joystick modem drivers, you may have some
problems.

Do you speak C? The cc65 compiler is available for the Atari 8-bits
and should produce efficient code, probably much faster and compact
than a BASIC compiler will ever do.

I know C might be more tricky than BASIC, but if you've contemplated
assembly language, chances are that you can get your way around in C
as well.

Well, yes. (-; The current routines are very fine as they are, but
just not "absolutely perfect" if you understand what I mean.. Yeah, I
tend to be picky at times.

Greetings,
Thomas

ftp.spudster.org has abc and mmg, but I don't think all versions.
the xs4all.nl site, with holme's archives has abc 1.02, 1.03, something
like
that. I haven't much luck with the xs4all site. The user is ......??
can't
remember, the pswd is atari4ever. MMG and ABC were copy protected
but the ones in Holme's was cracked. TXG runs xs4all.nl. I used
ABC 1.02 I think it was, on a800 emulator, the 1.03 didn't work.
I prefer ABC, but you can't have any floating point math in your program
and a few other things, like no symbolic references (like GOTO JUMP1)
and no dynamic DIMs, and a few other things. I think MMG will do
floating point.

I have a book where the source codes of DOS 2.5, DOS 2.0 and DOS XL
are listed. There are explanations to source codes, too. Unfortunately
the book is in Polish.

I use an awesome atari basic compliler from Datasoft. No run-times. It
creates just a single EXE or OBJ file that can be loaded from DOS and
it executes automatically. Some limitations are mustn't use RESTORE
statements and all DATA staments must be at the end of the
program...as well as some RANDOM function changes I have the
manual..so you can just check with me if something fails to compile or
work correctly.

The way the compiler works is it comes with a BOOT disk and a
WORKDISK. Simply copy your program onto the WORKDISK in BASIC
TOKENIZED form and they reccommend you list your program, reboot,
enter the program then save as .BAS to the workdisk. After you boot
the program disk, press C for compiler, replace the program disk with

the WORKDISK that has some complier files along with your .BASic program, it will ask for the input BASIC file and your OUTPUT obj file, makes 3 passes and then you have the option to run the complied program to test it. This works on both Atari800 Win Plus as well as the Atari++ emulators, although you could crank up the compile speed on the Atari800 which is an advantage over the Atari++.

Well as a follow up I have good news. I tore my garage apart trying to find some more power supplies. Couldn't find anything and went to my storage building today and found tons of power supplies. I plugged my Indus into a 5200 p/s and all is well. Also during my scavaging I found a second Indus. Too bad these things aren't so popular anymore. Does anyone have the info to mod a xf551 into a 3 1/2" ? I'm interested in doing that. Thanks!

Nope. I never bothered to learn anything besides assembly and BASIC. I
probably should. One question... Aside from vast imporvements, how much
different is C for the Atari and a slightly more modern day version, like
C++? I mean, if I learn one, then the other should be pretty easy, right?

The cc65 compiler is available for the Atari 8-bits
> and should produce efficient code, probably much faster and compact
> than a BASIC compiler will ever do.

Isn't cc65 by OSS, or was that the MAC65? Another really good one that I've
heard of is "Action!", but I don't know anythig about it.

>

Depends what is meant by "absolutely perfect" :)

Do I want to add more execution time and memory code space to perform
an extra check that would only be needed at coding time...and not in
the final runtime environment after the programmer has sorted out his
memory problems...nope :)

I think if I added the check, it would make it less perfect in a
runtime envirnoment than it presently is...

heh :)

The particular compiler cc65 should be quite decent, except for
floating-point operations, bit fields and possibly any recent
changes in CX99 or whatever is the latest standard

> like C++?

C++ is a completely (well..) different language, based upon C syntax
but with added elements for object orientation. There is probably no
C++ compiler at all for 8-bit computers (I'd love to be proven wrong!).

<sarcasm>
The beauty of C++ is that it has kept evolving and changing its syntax
constantly since it was defined, so compiler developers will never get
bored not needing to implement new or different functionality.
</sarcasm>

> I mean, if I learn one, then the other should be pretty easy, right?

Yes. You can write C code and use a C++ compiler, but not vice versa.
If you go directly into studying C++, you will probably learn its
syntax and mechanisms rather than the ones it has inherited from C.
On the other hand, a C programmer who steps into C++ might create a
odd looking beast of code, mixing elements and mechanisms according
to what the programmer is aware of (someone like me :-).

> Isn't cc65 by OSS

The original copyright says John R. Dunning 1989. It was from the
beginning an Atari compiler but has been ported to other 6502 based
systems like the Commodores, Atari II and Oric.

> I mastered assembly/ML when I was like 10 years old.

Gah! I probably didn't touch it until 15 and wrote my first useful
machine code program past my 20th birthday.

> I just don't really like writing very large programs with it.

Me neither. I believe a 4K program would be my upper limit on what
I can accomplish only with machine code.

Adjusting the speed "upwards" (i.e. make it run faster) was added
in the 1.28 that is available since monday at the "usual page". (-;

You can also try to install the math pack Os patch which will improve
the speed of all math operations emormously. (As in: The host computes
the sqrt, not the 6502.)

So long,
Thomas

Hi all! Does anyone have for sale or know where I can get the adapter
that fits the ICD MIO to a 130xe computer? Thanks!

Neither of my browsers are able to access the files.

Then use an FTP client.

Gav

# 5019. FS: Complete Atari 800 computer system (Davis, CA)

Newsgroup: comp.sys.atari.8bit
Date: 2003-09-04 00:26:06 UTC

I've got a complete, working Atari 800 computer system (from circa 1980-82)
for sale.

It has all been tested and works. Includes an Atari 1050 5.25" floppy drive,
joysticks, a Commodore Amiga monitor (can also be used with VCR or other game
systems), and a number of games on both cartridge and disk.

$40 OBO! E-mail me or follow-up on one of these newsgroups!

-bill!

PS - For those of you who know me and may have concern, don't worry...
I've still got my Atari 800XL and tons of cartridges and stuff that
I'm NOT getting rid of. :^)

I did. The host would not accept my user name (atari8) or password
(atari4ever).

You mean you're not looking forward to the Christmas in December Sale
which will be starting in just a few short months?

George

## 5022. Atari 800 emulator for the Xbox

Newsgroup: comp.sys.atari.8bit
